Mr. Mathew Franklin, Chairperson
Ione Band of Miwok Indians
P.O. Box 1190
Ione, CA 95640

Dear Mr. Franklin:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007. Additional cultural resources investigations will likely be needed in the future as redevelopment plans are refined.

We request your assistance in identifying any resources or sites within the approximate 5,032-acre portion of the Inland Area that have special significance to your Tribe. Information provided by your Tribe will be respected and will remain

California Valley Miwok Tribe
10601 Escondido Place
Stockton, CA 95212

Dear Ms. Burley:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. Mr. Lloyd Mathieson, Chairperson
Chicken Ranch Rancheria
P.O. Box 1159
Jamestown, CA 95327

Dear Mr. Mathieson:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007. Additional cultural resources investigations will likely be needed in the future as redevelopment plans are refined.

We request your assistance in identifying any resources or sites within the approximate 5,032-acre portion of the Inland Area that have special significance to your Tribe. Information provided by your Tribe will be respected and will remain

Ms. Margaret Dalton, Chairperson
Jackson Band of Me-wuk Indians
Jackson Rancheria
P.O. Box 1090
Jackson, CA 95642

Dear Ms. Dalton:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007. Additional cultural resources investigations will likely be needed in the future as redevelopment plans are refined.

We request your assistance in identifying any resources or sites within the approximate 5,032-acre portion of the Inland Area that have special significance to your Tribe. Information provided by your Tribe will be respected and will remain

Mr. Milford Wayne Donaldson
State Historic Preservation officer
Office of Historic preservation
1416 9th Street, Room 1442-7
Sacramento, CA 95814

Dear Mr. Donaldson:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800. The Navy is initiating consultation for this undertaking and seeking concurrence with the proposed project Area of Potential Effects (APE) per 36 CFR 800.4(a)(1).

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP). The Integrated Cultural Resources Plan (ICRMP) recommended that the DoN consider reevaluating potential eligibility for selected buildings based upon the passage of time and the acquisition of new information. Reevaluation of buildings and structures would likely occur in conjunction with the NEPA process.

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007.

P.O Box 1340
Shingle Springs, CA 95682

Dear Mr. Fonesco:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007. Additional cultural resources investigations will likely be needed in the future as redevelopment plans are refined.

Mr. Kevin Day, Chairperson
Tuolumne Rancheria
P.O. Box 699
Tuolumne, CA 95379

Dear Mr. Day :

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007. Additional cultural resources investigations will likely be needed in the future as redevelopment plans are refined.

We request your assistance in identifying any resources or sites within the approximate 5,032-acre portion of the Inland Area that have special significance to your Tribe. Information provided by your Tribe will be respected and will remain

Ms. Rhonda L. Morningstar Pope, Spokesperson
Buena Vista Rancheria
P.O. Box 162283
Sacramento, CA 95816

Dear Ms. Pope:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007. Additional cultural resources investigations will likely be needed in the future as redevelopment plans are refined.

We request your assistance in identifying any resources or sites within the approximate 5,032-acre portion of the Inland Area that have special significance to your Tribe. Information provided by your Tribe will be respected and will remain

Concord, CA 94520

Dear Sir or Madam:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007. Additional cultural resources investigations will likely be needed in the future as redevelopment plans are refined.

We greatly appreciate any comments or concerns you may have regarding the project and would like to know whether you wish to participate as a consulting party per 36 CFR 800.2(c)(5). Enclosure 3 is provided to help you identify and address any concerns you

Dear Ms. Garibay:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007. Additional cultural resources investigations will likely be needed in the future as redevelopment plans are refined.

We greatly appreciate any comments or concerns you may have regarding the project and would like to know whether you wish to participate as a consulting party per 36 CFR 800.2(c)(5). Enclosure 3 is provided to help you identify and address any concerns you

Dear Mr. Galvan:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007. Additional cultural resources investigations will likely be needed in the future as redevelopment plans are refined.

We greatly appreciate any comments or concerns you may have regarding the project and would like to know whether you wish to participate as a consulting party per 36 CFR 800.2(c)(5). Enclosure 3 is provided to help you identify and address any concerns you

Katherine Erolinda Perez
PO Box 717
Linden, CA 95236

Dear Ms. Perez:

The purpose of this letter is to inform you that the Department of Navy (DoN), Base Realignment and Closure (BRAC) Program Management Office plans to transfer approximately 5,032 acres of property from federal ownership at Naval Weapons Station Seal Beach Detachment Concord (NAVWPNSTA Seal Beach Det Concord), located in Contra Costa County, California (Enclosure 1). The Inland Area of the base is being closed in accordance with the enacted BRAC 2005 recommendations. This undertaking primarily comprises of the disposal and reuse of the property. The undertaking could also include layaway, caretaker maintenance and potential interim leases. This undertaking and its effects are being considered under Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended, and implementing regulations 36 CFR 800.

The APE for this undertaking is the approximate 5,032-acre parcel within the "Inland Area" at NAVWPNSTA Seal Beach Det Concord that is to be transferred from federal ownership (Enclosure 2).

This parcel, which is located entirely within the incorporated City of Concord, was deactivated in 1999 and declared surplus property by the DoN in March 2007. The City of Concord was designated as the Local Redevelopment Authority (LRA) by the Office of Economic Adjustment in 2005. The City of Concord, as the LRA, initiated the Concord Community Reuse Project (CCRP) to prepare a Redevelopment Plan for the site. The City of Concord is currently preparing the Redevelopment Plan, and determined that it will prepare an Environmental Impact Report in accordance with the California Environmental Quality Act to analyze the potential environmental impacts of alternatives developed through the CCRP. The DoN intends to prepare an Environmental Impact Statement (EIS) in accordance with the National Environmental Policy Act (NEPA) once the LRA's Redevelopment Plan is completed. The DoN plans to assess the effects for this undertaking in conjunction with its EIS preparation.

While numerous cultural resources investigations have been conducted at NAVWPNSTA Seal Beach Det Concord, only a small portion of the property has been investigated archaeologically. Four archaeological resources (two prehistoric and two historic) have been recorded within the study area. These include Ca-CCo-680, P-07-000861, P-07-000485, and P-07-000860. Ca-CCo-680 consists of a sparse, albeit diverse, scatter of Native American artifacts (i.e. mortars and pestles, an antler wedge, a stone "chopper" and other flaked stone tools and debris) and dietary remains (i.e. mammal bone and marine and freshwater shellfish). A possible hearth feature and several pieces of human bone were also identified as the result of a small test excavation conducted in 1996. All of the material recovered during this work was reburied at the site. The second prehistoric site, P-07-000861, is a bedrock milling feature consisting of four mortar cups and a possible milling slick on a basalt outcrop. Historic archaeological resources include a corral/holding pen (P-07-000485) of undetermined age and a historical stone cistern (P-07-000860) that was built between 1932 and 1935 for use on the Ralph Bollman property and dairy.

All buildings and structures utilized by the DoN have been inventoried and evaluated (Self 1993; JRP Historical Consulting Services 1998) and none have been found to qualify for listing on the National Register of Historic Places (NRHP).

An archaeological investigation of the property is proposed to gather baseline cultural resources information early in the BRAC process for consideration in the reuse planning effort. ASM Affiliates, Inc. shall conduct the archaeological investigation of the entire 5,032 acre NAVWPNSTA Seal Beach Det Concord "Inland Area" study area that is part of this action. The investigation shall consist of a pedestrian (walkover) archaeological survey that incorporates vegetation clears designed to remove surface vegetation and improve surface visibility and overall survey effectiveness. The vegetation clears, conducted at various intervals along the survey transects, shall be no greater in size than 1m x 1m and generally not exceed 10cm in depth. No vegetation clears shall be conducted within the boundaries of the previously recorded archaeological sites. No artifacts shall be collected as part of this survey investigation. The survey is currently planned to take place in late August and September 2007. Additional cultural resources investigations will likely be needed in the future as redevelopment plans are refined.

We greatly appreciate any comments or concerns you may have regarding the project and would like to know whether you wish to participate as a consulting party per 36 CFR 800.2(c)(5). Enclosure 3 is provided to help you identify and address any concerns you

DEPARTMENT OF THE NAVY
BASE REALIGNMENT AND CLOSURE
PROGRAM MANAGEMENT OFFICE WEST
1455 FRAZEE RD, SUITE 900
SAN DIEGO, CA 92108-4310

5750
Ser BPMOW.els/0635
OCT 11 2012

Mr. Tristan Tozer
California Department of Parks and Recreation
Office of Historic Preservation (OHP)
1725 23rd Street, Suite 100
Sacramento, CA 95816

Dear Mr. Tozer:

The purpose of this letter is to re-engage Section 106 consultation regarding the Navy's proposed Base Realignment and Closure (BRAC) transfer of Federal property at Naval Weapons Station Seal Beach (NWSSB) Detachment Concord ("former NWS Concord," hereafter), located in Contra Costa County, California (USN#070813A). The Navy is also concurrently re-engaging consultation with Federally-recognized Indian Tribes and other potentially-interested agencies and individuals. We invite you to participate in our first consultation meeting proposed for **Thursday, November 8, 2012 from 1:00-4:00PM in Concord, CA.** We also respectfully request a teleconference with appropriate SHPO staff in advance of the consultation meeting in order to discuss Navy's plans for consultation and seek preliminary input from SHPO on appropriate treatment for historic properties subject to the transfer. We anticipate that at least one prehistoric archaeological site containing human remains may be eligible for listing in the National Register of Historic Places (NRHP) and will be transferred out of Federal ownership. This letter summarizes Navy's prior consultation efforts and compliance actions to date, and outlines our plans for future consultation.

2007 Initiation of Consultation

In accordance with the enacted BRAC 2005 recommendations, the former NWS Concord was identified for closure and missions operationally ceased in 2008. Since that time, the Navy has transferred property to the U.S. Army and U.S. Coast Guard via Federal-to-Federal property transfers. The Navy is proposing to transfer the remaining portion of the "Inland Area" out of Federal ownership (Enclosure 1). The Navy initiated consultation on this undertaking with the California State Historic Preservation Office (SHPO) and other-potentially-interested parties on August 6, 2007 and requested concurrence on the determination of the undertaking's Area of Potential Effects (APE). The Navy defined the APE as the approximately 5,032-acre portion of the Inland Area proposed for transfer. The Navy received SHPO concurrence on the APE determination on September 12, 2007 (USN#070813A).

Section 106 Compliance Efforts Since 2007

Since 2007, the Navy has conducted an archaeological survey (2008), a historic building evaluation (2009), and most recently, the fieldwork for an archaeological evaluation (2012).

Identification and Evaluation of Archaeological Resources

In 2008, the Navy completed a Phase I intensive, pedestrian survey of the "Inland Area" (ASM Affiliates–Garcia-Herbst and Hale, 2008). The survey included systematic transects spaced at no more than 25-m intervals and generally oriented parallel to terrain. Rakes were used to clear 1x1-m areas of vegetation from the ground surface at minimum intervals of 100 meters except in locations of known archaeological resources and in portions of the survey area where the visibility was not encumbered by vegetation. Approximately 20 percent of the APE consisted of steeply sloped (>30 percent) upland regions that were subjected to a mixed survey strategy focusing on ridges, mid-slope terraces, and along watercourses where isolated milling stations and task specific sites might be encountered. The result of the survey was the identification and/or re-identification of a total of twenty-two archaeological sites and four archaeological isolates. These included the relocation of two prehistoric sites (CA-CCO-680, P-07-00861) and three historical archaeological sites (P-07-00860, P-07-000485, and P-07-2683); and the identification of seventeen new archaeological sites including one prehistoric site (CA-CCO-786) and sixteen historical archaeological sites. No artifacts were collected as part of the pedestrian survey.

Due to the potential to encounter human remains at prehistoric site CA-CCO-680, the Navy consulted with Federally-recognized Indian Tribes to develop a Native American Graves Protection and Repatriation Act (NAGPRA) Plan of Action under 43 CFR 10.5 prior to conducting a Phase II subsurface testing/evaluation program. To support implementation of the NAGPRA Plan of Action and to assist the Navy in identifying historic properties that may possess religious and cultural significance to Indian Tribes under 36 CFR 800.4(c)(1), the Navy invited representatives of the California Valley Miwok Tribe, the Ione Band of Miwok Indians, and the Shingle Springs Band of Miwok Indians to participate as Native American Specialists for the Phase II evaluation.

On August 24, 2012, the Navy completed the fieldwork for the Phase II archaeological evaluation of the identified archaeological resources from the 2008 survey. This effort included a subsurface archaeological testing program at prehistoric sites CA-CCO-680,

CA-CCO-786, and P-07-00861 and historical archaeological site CA-CCO-791H. During fieldwork, human remains and NAGPRA funerary objects were encountered at CA-CCO-680. In accordance with the NAGPRA Plan of Action, all human remains and NAGPRA cultural items were reburied on site. Although the Navy's archaeological evaluation report is still in development, the Navy anticipates that CA-CCO-680 may be eligible for the National Register. Additional archaeological sites may also be identified as eligible during the preparation of and consultation concerning the archaeological evaluation report.

Given the limited potential for subsurface archaeological data to be present at the remaining historical archaeological sites, which primarily include above-ground features from the mid to late 19th and early 20th century ranching occupation (i.e. foundations, fence lines, wells, windmills, corrals, mine shafts, etc…), the Navy's archaeological evaluation report will also include a comprehensive historic, rural landscape evaluation of the remaining historic archaeological resources that were not tested.

Identification of Historic Resources

In 2009, the Navy conducted an evaluation of historic resources in the "Inland Area" proposed for transfer. The 2009 draft evaluation is titled "(DRAFT) *UPDATE REPORT*- Historic Building Inventory and Evaluation, Concord Naval Weapons Station, Contra Costa County, California" (JRP Historical Consulting Services, 2009) and provides an update to prior historic evaluations (William Self Associates, 1993; JRP Historical Consulting Services, 1998). The 2009 draft historic resources evaluation report inventoried and evaluated 422 buildings and structures and concludes that none meet the criteria for listing in the NRHP. The Navy has not yet consulted on the findings of this evaluation report, but the Navy anticipates that no buildings or structures within the APE will be eligible for the NRHP.

Plans for Future Consultation

As mentioned above, the Navy is re-engaging Section 106 consultation with SHPO and interested parties and is proposing a consultation meeting for the following date and time:

Section 106 Consultation Meeting for the former Naval Weapons Station, Concord
Thursday, November 8, 2012
1:00PM to 4:00PM
Concord Senior Center
2727 Parkside Circle
Concord, CA 94519

5750
Ser BPMOW.els/0635
OCT 11 2012

The purpose of this consultation meeting is to re-engage consultation on the Navy's undertaking and other reasonably-foreseeable effects of reuse, provide an overview of our plans for future consultation, and identify interested consulting parties. The Navy is concurrently contacting Federally-recognized Indian Tribes and potentially-interested parties to re-engage consultation and invite them to the proposed meeting (Enclosures 2 and 3). The Navy may also identify additional interested parties through the public participation components of the National Environmental Policy Act (NEPA) process.

Request for SHPO Assistance

In addition to requesting SHPO participation in our first Section 106 consultation meeting for this project, the Navy also respectfully requests a pre-meeting (via teleconference) with relevant SHPO staff to discuss Navy's plans for consultation and to seek preliminary input from SHPO on appropriate treatment alternatives for historic properties subject to transfer. Preliminary data indicates that at least one prehistoric archaeological site may be eligible and the Navy would like to explore a range of treatment alternatives to avoid, minimize, or mitigate adverse effects associated with the transfer and the reasonably-foreseeable effects of reuse. Specifically, we would like to discuss historic preservation covenants or other "adequate and legally enforceable restrictions or conditions to ensure long-term preservation of the property's historic significance" as means to avoid the adverse effects of transfer out of Federal ownership, consistent with 36 CFR 800.5(a)(2)(vii).

Should you require additional information or wish to discuss further, please contact Ms. Erica Spinelli, Senior Cultural Resources Manager, at (619) 532-0980 or by email at erica.spinelli@navy.mil.

Sincerely,

KIMBERLY A. OSTROWSKI
Base Closure Manager

Dear Chairperson Burley, Chairperson Miller, and Chairman Fonseca:

The Navy is re-engaging consultation under Section 106 of the National Historic Preservation Act (NHPA) regarding the Navy's proposed Base Realignment and Closure (BRAC) transfer of Federal property at Naval Weapons Station Seal Beach (NWSSB) Detachment Concord, located in Contra Costa County, California ("former NWS Concord," hereafter) (Enclosure 1). We are contacting you because your tribes participated in our recent Native American Graves Protection and Repatriation Act (NAGPRA) consultation in support of the Navy's archaeological evaluation at the former NWS Concord. This letter summarizes Navy's prior Section 106 consultation efforts and compliance actions to date, and outlines our plans for future consultation. We invite you to attend the first Section 106 consultation meeting proposed for **Thursday, November 8, 2012 from 1:00-4:00PM** in Concord, CA. As requested below, please contact us to indicate your interest **by no later than Friday, October 19, 2012.**

2007 Initiation of Consultation

In accordance with the enacted BRAC 2005 recommendations, the former NWS Concord was identified for closure and missions operationally ceased in 2008. Since that time, the Navy has transferred property to the U.S. Army and U.S. Coast Guard via Federal-to-Federal property transfers. The Navy is proposing to transfer the remaining portion of the "Inland Area" out of Federal ownership (Enclosure 1). The Navy initiated consultation on this undertaking with the California State Historic Preservation Office (SHPO) and other-potentially-interested parties on August 6, 2007 and requested SHPO concurrence on the determination of the undertaking's Area of Potential Effects (APE). The Navy defined the APE as the

approximately 5,032-acre portion of the Inland Area proposed for transfer. The Navy received SHPO concurrence on the APE determination on September 12, 2007 (USN#070813A).

Section 106 Compliance Efforts Since 2007

Since 2007, the Navy has conducted an archaeological survey (2008), a historic building evaluation (2009), and most recently, the fieldwork for an archaeological evaluation (2012).

Identification and Evaluation of Archaeological Resources

In 2008, the Navy completed a Phase I intensive, pedestrian survey of the "Inland Area" (ASM Affiliates-Garcia-Herbst and Hale, 2008). The result of the survey was the identification and/or re-identification of a total of twenty-two archaeological sites and four archaeological isolates. These included the relocation of two prehistoric sites (CA-CCO-680, P-07-00861) and three historical archaeological sites (P-07-00860, P-07-000485, and P-07-2683); and the identification of seventeen new archaeological sites including one prehistoric site (CA-CCO-786) and sixteen historical archaeological sites. No artifacts were collected as part of the pedestrian survey.

Due to the potential to encounter human remains at prehistoric site CA-CCO-680, the Navy consulted with Federally-recognized Indian Tribes (including your Tribes) to develop a Native American Graves Protection and Repatriation Act (NAGPRA) Plan of Action under 43 CFR 10.5 prior to conducting a Phase II subsurface testing/evaluation program. To support implementation of the NAGPRA Plan of Action and to assist the Navy in identifying historic properties that may possess religious and cultural significance to Indian Tribes under 36 CFR 800.4(c)(1), the Navy invited representatives of the California Valley Miwok Tribe, the Ione Band of Miwok Indians, and the Shingle Springs Band of Miwok Indians to participate as Native American Specialists for the Phase II evaluation.

On August 24, 2012, the Navy completed the fieldwork for a Phase II archaeological evaluation of the identified archaeological resources from the 2008 survey. This effort included a subsurface archaeological testing program at prehistoric sites CA-CCO-680, CA-CCO-786, and P-07-00861 and historical archaeological site CA- CCO-791H. During fieldwork, human remains and NAGPRA funerary objects were encountered at CA-CCO-680. In accordance with the NAGPRA Plan of Action, all human remains and NAGPRA cultural items were reburied on site. Although the Navy's archaeological evaluation report is still in development, the Navy anticipates that CA-CCO-680 may be eligible

for the National Register. Additional archaeological sites may also be identified as eligible during the preparation of and consultation concerning the archaeological evaluation report.

Given the limited potential for subsurface archaeological data to be present at the remaining historical archaeological sites, which primarily include above-ground features from the mid to late 19th and early 20th century ranching occupation (i.e. foundations, fence lines, wells, windmills, corrals, mine shafts, etc…), the Navy's archaeological report will also include a comprehensive historic, rural landscape evaluation of the remaining historic archaeological resources that were not tested.

Identification and Evaluation of Historic Resources

In 2009, the Navy conducted an updated evaluation of historic resources in the Inland Area proposed for transfer. The 2009 evaluation report is titled "(DRAFT) *UPDATE REPORT*- Historic Building Inventory and Evaluation, Concord Naval Weapons Station, Contra Costa County, California" (JRP Historical Consulting Services, 2009) and provides an update to prior historic evaluations (William Self Associates, 1993; JRP Historical Consulting Services, 1998). The report inventoried and evaluated 422 buildings and structures and concludes that none meet the criteria for listing in the NRHP. In order to finalize the evaluation of historic resources, the Navy will be consulting with SHPO and interested parties on the 2009 draft report.

Plans for Future Consultation

As mentioned above, the Navy is re-engaging Section 106 consultation with SHPO and potentially-interested parties and is proposing a consultation meeting for the following date and time:

Section 106 Consultation Meeting for the former Naval Weapons Station, Concord
Thursday, November 8, 2012
1:00PM to 4:00PM

Concord Senior Center
2727 Parkside Circle
Concord, CA 94519

The purpose of this consultation meeting is to re-engage consultation on the Navy's undertaking and other reasonably-foreseeable effects of reuse, provide an overview of our plans for

future consultation, and identify interested consulting parties. Via separate correspondence, the Navy is concurrently re-engaging consultation with SHPO and other potentially-interested parties (Enclosure 2).

Indicating Interest in the Section 106 Consultation

Based upon your tribe's participation in the NAGPRA consultation, we assume that your tribes will be interested in participating in the Section 106 consultation concerning the proposed transfer of the former NWS Concord. To confirm your tribe's interest in the consultation, please email Ms. Erica Spinelli (erica.spinelli@navy.mil) , Senior Cultural Resources Manager, by no later than Friday, October 19, 2012. In your email, please confirm:

1. Whether your tribe is interested in participating in the Section 106 consultation concerning the proposed transfer of the former NWS Concord;
2. Whether representatives of your tribe plan to attend the November 8, 2012 meeting;
3. How many representatives of your tribe plan to attend the November 8, 2012 meeting;
4. Whether your tribe is interested in historic resources, archaeological resources, or both;
5. Contact information for your tribal representatives including name(s), email address(es), telephone number(s), and mailing address(es) so that we may contact your representatives during our consultation.

Should you have any questions, or require additional information, please contact Ms. Erica Spinelli, Senior Cultural Resources Manager, at (619) 532-0980 or by email at erica.spinelli@navy.mil.

Sincerely,

KIMBERLY A. OSTROWSKI
Base Closure Manager

OCT 1 1 2012

Dear Potentially-Interested Parties:

The Navy is re-engaging consultation under Section 106 of the National Historic Preservation Act (NHPA) regarding the Navy's proposed Base Realignment and Closure (BRAC) transfer of Federal property at Naval Weapons Station Seal Beach (NWSSB) Detachment Concord, located in Contra Costa County, California ("former NWS Concord," hereafter) (Enclosure 1). We are contacting agencies, organizations, and individuals that may have an interest in archaeological or historic resources at the former NWS Concord (Enclosure 2). This letter summarizes Navy's prior consultation efforts and compliance actions to date, and outlines our plans for future consultation. Should you be interested in participating in this Section 106 consultation, we invite you to attend the first consultation meeting proposed for **Thursday, November 8, 2012 from 1:00-4:00PM** in Concord, CA. As requested below, please contact us to indicate your interest in this consultation **by no later than Friday, October 19, 2012.**

2007 Initiation of Consultation

In accordance with the enacted BRAC 2005 recommendations, the former NWS Concord was identified for closure and was operationally closed in 2008. Since that time, the Navy has transferred property to the U.S. Army and U.S. Coast Guard via Federal-to-Federal property transfers. The Navy is proposing to transfer the remaining portion of the "Inland Area" out of Federal ownership (Enclosure 1). The Navy initiated consultation on this undertaking with the California State Historic Preservation Office (SHPO) and other-potentially-interested parties on August 6, 2007 and requested SHPO concurrence on the determination of the undertaking's Area of Potential Effects (APE). The Navy defined the APE as the approximately 5,032-acre portion of the "Inland Area" proposed for transfer. The Navy received SHPO concurrence on the APE determination on September 12, 2007 (USN#070813A).

Section 106 Compliance Efforts Since 2007

Since 2007, the Navy has conducted an archaeological survey (2008), a historic building evaluation (2009), and most recently, the fieldwork for an archaeological evaluation (2012).

Identification and Evaluation of Archaeological Resources

In 2008, the Navy completed a Phase I intensive, pedestrian survey of the "Inland Area" (ASM Affiliates-Garcia-Herbst and Hale, 2008).

The result of the survey was the identification and/or re-identification of a total of twenty-two archaeological sites and four archaeological isolates. These included the relocation of two prehistoric sites (CA-CCO-680, P-07-00861) and three historical archaeological sites (P-07-00860, P-07-000485, and P-07-2683); and the identification of seventeen new archaeological sites including one prehistoric site (CA-CCO-786) and sixteen historical archaeological sites. No artifacts were collected as part of pedestrian survey. Due to the potential to encounter human remains at prehistoric site CA-CCO-680, the Navy consulted with Federally-recognized Indian Tribes to develop a Native American Graves Protection and Repatriation Act (NAGPRA) Plan of Action under 43 CFR 10.5. prior to conducting a Phase II subsurface testing/evaluation program. To support implementation of the NAGPRA Plan of Action and to assist the Navy in identifying historic properties that may possess religious and cultural significance to Indian Tribes under 36 CFR 800.4(c) (1), the Navy invited representatives of the California Valley Miwok Tribe, the Ione Band of Miwok Indians, and the Shingle Springs Band of Miwok Indians to participate as Native American Specialists for the Phase II evaluation.

On August 24, 2012, the Navy completed the fieldwork for a Phase II archaeological evaluation of the identified archaeological resources from the 2008 survey. This effort included a subsurface archaeological testing program at prehistoric sites CA-CCO-680, CA-CCO-786, and P-07-00861 and historical archaeological site CA- CCO-791H. During fieldwork, human remains and NAGPRA funerary objects were encountered at CA-CCO-680. In accordance with the NAGPRA Plan of Action, all human remains and NAGPRA cultural items were reburied on site. Although the Navy's archaeological evaluation report is still in development, the Navy anticipates that CA-CCO-680 may be eligible for the National Register. Additional archaeological sites may also be identified as eligible during the preparation of and consultation concerning the archaeological evaluation report.

Given the limited potential for subsurface archaeological data to be present at the remaining historical archaeological sites, which primarily include above-ground features from the mid to late 19th and early 20th century ranching occupation (i.e. foundations, fence lines, wells, windmills, corrals, mine shafts, etc…), the Navy's archaeological report will also include a comprehensive historic, rural landscape evaluation of the remaining historic archaeological resources that were not tested.

Identification and Evaluation of Historic Resources

In 2009, the Navy conducted an updated evaluation of historic resources in the Inland Area proposed for transfer. The 2009 evaluation report is titled "(DRAFT) *UPDATE REPORT- Historic* Building Inventory and Evaluation, Concord Naval Weapons Station, Contra Costa County, California" (JRP Historical Consulting Services, 2009) and provides an update to prior historic evaluations (William Self Associates, 1993; JRP Historical Consulting Services, 1998). The report inventoried and evaluated 422 buildings and structures and concludes that none meet the criteria for listing in the NRHP. In order to finalize the evaluation of historic resources, the Navy will be consulting with SHPO and interested parties on the 2009 draft report.

Plans for Future Consultation

As mentioned above, the Navy is re-engaging Section 106 consultation with SHPO and potentially-interested parties and is proposing a consultation meeting for the following date and time:

Section 106 Consultation Meeting for the former Naval Weapons Station, Concord
Thursday, November 8, 2012
1:00PM to 4:00PM

Concord Senior Center
2727 Parkside Circle
Concord, CA 94519

The purpose of this consultation meeting is to re-engage consultation on the Navy's undertaking and other reasonably-foreseeable effects of reuse, provide an overview of our plans for future consultation, and identify interested consulting parties. Via separate correspondence, the Navy is concurrently re-engaging consultation with SHPO and with Federally-recognized Indian Tribes.

Indicating Interest in the Section 106 Consultation

Should you be interested in participating in the Section 106 consultation concerning the proposed transfer of the former NWS Concord, please email Ms. Erica Spinelli (erica.spinelli@navy.mil) , Senior Cultural Resources Manager, by no later than Friday, October 19, 2012. In your email, please indicate:

JAN 30 2013

Dear Consulting Parties:

The Navy seeks your input on the findings of the enclosed *Draft Historic Building Inventory and Evaluation Update Report, Inland Area, Concord Naval Weapons Station, Contra Costa County, California* (December, 2012) ("Draft Historic Evaluation Report," hereafter) (Enclosure (1)). As discussed at our November 18, 2012 consultation meeting, the Draft Historic Evaluation Report was prepared to support Navy's compliance with Section 106 for the proposed Base Realignment and Closure (BRAC) transfer at Naval Weapons Station Seal Beach (NWSSB) Detachment Concord ("former NWS Concord," hereafter), located in Contra Costa County, California (SHPO Reference: USN070813A). Specifically, the Draft Historic Evaluation Report aims to identify whether there are historic buildings or structures located within the Area of Potential Effect (APE) (Inland Area of the former NWS Concord proposed for transfer). We respectfully request your input on our report's findings within 30 days, or **by March 1, 2013.** Via this correspondence, the Navy is concurrently seeking and considering the input of the consulting parties identified in the distribution list included in Enclosure (2). Via separate correspondence, the Navy is additionally seeking the concurrence of the State Historic Preservation Officer (SHPO).

The enclosed Draft Historic Evaluation Report provides an update to two previous Navy evaluation reports: one for World War II-era buildings and structures (Self and Associates, 1993) and one for Cold War-era resources (JRP, 1998). Taken together, the Self and Associates and JRP evaluations concluded that none of the Navy's buildings or structures within the Inland Area were eligible for the NRHP. The Navy consulted on these studies and received SHPO concurrence on both in the 1990s. The enclosed Draft Historic Evaluation Report re-affirms the findings of the two previous studies and confirms that the passage of time has not affected the eligibility status of resources that were less than 50 years of age at the time of their initial evaluation. Overall, the enclosed Draft Historic Evaluation Report concludes that none of the 422 historic buildings or structures evaluated is eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historic Resources (CRHR), either individually or as part of a historic district.

The evaluation of NRHP/CRHR eligibility for buildings and structures within the APE is included in Chapter 4 of the enclosed report, with overall conclusions provided at the end of that chapter. Department of Parks Recreation (DPR) 523 site forms in Appendix B record the resources and provide resource-specific evaluations of NRHP/CRHR eligibility. Similar resources are grouped together by function or by general area on these DPR 523 site forms. Appendix A, Table 1 can assist the reader in identifying DPR 523 site forms of interest: Table 1 provides a list of all evaluated resources by Navy Building Number / Function and indicates which DPR 523 form addresses each resource. Appendix B then contains a large-format map of the APE/Inland Area, followed by the DPR 523 forms in alphabetical order by Resource Name (located in the top right corner of the form).

Additionally, it is important to note that the Contra Costa Canal (including its subsidiary, the Clayton Canal) is located within the APE and is a historic property eligible for the NRHP/CRHR as determined by consensus with SHPO on March 9, 2005 (SHPO Reference: FHWA050131A). Portions of the Contra Costa Canal and Clayton Canal are located within the Navy's APE and are resources owned by the US Bureau of Reclamation and operated by the Contra Costa Water District. Therefore, via the correspondence included in Enclosure 3, the Navy is inviting the USBR and CCWD to participate in this Section 106 consultation. The enclosed Historic Evaluation Report evaluates bridges and culverts associated with the Contra Costa Canal, but the Navy's report does not re-evaluate the Contra Costa Canal or Clayton Canal.

We respectfully request your input on the findings of the enclosed report within 30 days, or **by no later than March 1, 2013.** You will soon receive an email providing an electronic version of a "consulting party comment form." To expedite our response to comments, we respectfully request that you submit your organization's comments in the provided comment matrix and via email to Ms. Erica Spinelli (erica.spinelli@navy.mil) by March 1, 2013.

Mr. Tristan Tozer
California Department of Parks and Recreation
Office of Historic Preservation (OHP)
1725 23rd Street, Suite 100
Sacramento, CA 95816

Dear Mr. Tozer:

The Navy seeks State Historic Preservation Officer (SHPO) concurrence on the findings of the enclosed *Draft Historic Building Inventory and Evaluation Update Report, Inland Area, Concord Naval Weapons Station, Contra Costa County, California* (December, 2012) ("Draft Historic Evaluation Report," hereafter) (Enclosure (1)). As discussed at our November 18, 2012 consultation meeting, the Draft Historic Evaluation Report was prepared to support Navy's compliance with Section 106 for the proposed Base Realignment and Closure (BRAC) transfer at Naval Weapons Station Seal Beach (NWSSB) Detachment Concord ("former NWS Concord," hereafter), located in Contra Costa County, California (SHPO Reference: USN070813A). Specifically, the Draft Historic Evaluation Report aims to identify whether there are historic buildings or structures located within the Area of Potential Effect (APE) (Inland Area of the former NWS Concord proposed for transfer). We respectfully request your concurrence on our report's findings within 30 days, or **by March 1, 2013.** Via separate correspondence, the Navy is also concurrently seeking and considering the input of the consulting parties identified in the distribution list included in Enclosure (2).

The enclosed Draft Historic Evaluation Report provides an update to two previous Navy evaluation reports: one for World War II-era buildings and structures (Self and Associates, 1993) and one for Cold War-era resources (JRP, 1998). Taken together, the Self and Associates and JRP evaluations concluded that none of the Navy's buildings or structures within the Inland Area were eligible for the NRHP. The Navy consulted on these studies and received SHPO concurrence on both in the 1990s. The enclosed Draft Historic Evaluation Report re-affirms the findings of the two previous studies and confirms that the passage of time has not

affected the eligibility status of resources that were less than 50 years of age at the time of their initial evaluation. Overall, the enclosed Draft Historic Evaluation Report concludes that none of the 422 historic buildings or structures evaluated is eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historic Resources (CRHR), either individually or as part of a historic district.

The evaluation of NRHP/CRHR eligibility for buildings and structures within the APE is included in Chapter 4 of the enclosed report, with overall conclusions provided at the end of that chapter. Department of Parks Recreation (DPR) 523 site forms in Appendix B record the resources and provide resource-specific evaluations of NRHP/CRHR eligibility. Similar resources are grouped together by function or by general area on these DPR 523 site forms. Appendix A, Table 1 can assist the reader in identifying DPR 523 site forms of interest: Table 1 provides a list of all evaluated resources by Navy Building Number / Function and indicates which DPR 523 form addresses each resource. Appendix B then contains a large-format map of the APE/Inland Area, followed by the DPR 523 forms in alphabetical order by Resource Name (located in the top right corner of the form).

Additionally, it is important to note that the Contra Costa Canal (including its subsidiary, the Clayton Canal) is located within the APE and is a historic property eligible for the NRHP/CRHR as determined by consensus with SHPO on March 9, 2005 (SHPO Reference: FHWA050131A). Portions of the Contra Costa Canal and Clayton Canal are located within the Navy's APE and are resources owned by the US Bureau of Reclamation and operated by the Contra Costa Water District. Therefore, via the correspondence included in Enclosure 3, the Navy is inviting the USBR and CCWD to participate in this Section 106 consultation. The enclosed Historic Evaluation Report evaluates bridges and culverts associated with the Contra Costa Canal, but the Navy's report does not re-evaluate the Contra Costa Canal or Clayton Canal.

P.O. Box H2O
Concord, CA 94524-2099

Dear Ms. Leigh and Mr. Seedall:

As discussed with your staff via telephone on January 16 and 17, 2013, the Navy is conducting consultation under Section 106 of the National Historic Preservation Act (NHPA) regarding the Navy's proposed Base Realignment and Closure (BRAC) transfer of Federal property at the Naval Weapons Station Seal Beach (NWSSB) Detachment Concord, located in Contra Costa County, California ("former NWS Concord," hereafter). The Navy is inviting the United States Bureau of Reclamation (USBR) and Contra Costa County Water District (CCCWD) to participate in this consultation because the USBR-owned and CCCWD-operated Contra Costa Canal and Clayton Canal are located within the Navy's Area of Potential Effect (APE). This letter summarizes Navy's compliance actions to date, and outlines plans for future consultation. Additionally, the Navy seeks your input on the findings of the enclosed *Draft Historic Building Inventory and Evaluation Update Report, Inland Area, Concord Naval Weapons Station, Contra Costa County, California* (December, 2012) ("Draft Historic Evaluation Report," hereafter) (Enclosure (1)). We respectfully request your input concurrence on the report's findings within 30 days, or **by March 1, 2013.** The Navy is concurrently seeking and considering the input of the consulting parties identified in the distribution list included in Enclosure (2), and seeking the concurrence of the State Historic Preservation Officer (SHPO).

2007 Initiation of Consultation

In accordance with the enacted BRAC 2005 recommendations, the former NWS Concord was identified for closure and was operationally closed in 2008. Since that time, the Navy has transferred property to the U.S. Army and U.S. Coast Guard via Federal-to-Federal property transfers. The Navy is proposing to transfer the remaining portion of the "Inland Area" out of Federal ownership (Enclosure 3). The Navy initiated consultation on this undertaking with the California State Historic Preservation Office (SHPO) and other-potentially-interested parties on August 6, 2007 and requested SHPO concurrence on the determination of the APE. The Navy defined the APE as the approximately 5,032-acre portion of the "Inland Area" proposed for transfer. The Navy received SHPO concurrence on the APE determination on September 12, 2007 (USN#070813A).

Section 106 Compliance Efforts Since 2007

Since 2007, the Navy has conducted an archaeological survey (2008), a historic building evaluation (2009, updated 2012), the fieldwork for an archaeological evaluation (2012), and re-engaged consultation in November 2012.

Identification and Evaluation of Archaeological Resources

In 2008, the Navy completed a Phase I intensive, pedestrian survey of the "Inland Area" (ASM Affiliates-Garcia-Herbst and Hale, 2008). The result of the survey was the identification and/or re-identification of a total of twenty-two archaeological sites and four archaeological isolates. These included the relocation of two prehistoric sites (CA-CCO-680, P-07-00861) and three historical archaeological sites (P-07-00860, P-07-000485, and P-07-2683); and the identification of seventeen new archaeological sites including one prehistoric site (CA-CCO-786) and sixteen historical archaeological sites. No artifacts were collected as part of the pedestrian survey.

Due to the potential to encounter human remains at prehistoric site CA-CCO-680, the Navy consulted with Federally-

recognized Indian Tribes to develop a Native American Graves Protection and Repatriation Act (NAGPRA) Plan of Action under 43 CFR 10.5. prior to conducting a Phase II subsurface testing/evaluation program. To support implementation of the NAGPRA Plan of Action and to assist the Navy in identifying historic properties that may possess religious and cultural significance to Indian Tribes under 36 CFR 800.4(c)(1), the Navy invited representatives of the California Valley Miwok Tribe, the Ione Band of Miwok Indians, and the Shingle Springs Band of Miwok Indians to participate as Native American Specialists for the Phase II evaluation.

On August 24, 2012, the Navy completed the fieldwork for a Phase II archaeological evaluation of the identified archaeological resources from the 2008 survey. This effort included a subsurface archaeological testing program at prehistoric sites CA-CCO-680, CACCO-786, and P-07-00861 and historical archaeological site CA-CCO-791H. During fieldwork, human remains and NAGPRA funerary objects were encountered at CA-CCO-680. In accordance with the NAGPRA Plan of Action, all human remains and NAGPRA cultural items were reburied on site. Although the Navy's archaeological evaluation report is still in development, the Navy anticipates that CA-CCO-680 may be eligible for the National Register. Additional archaeological sites may also be identified as eligible during the preparation of and consultation concerning the archaeological evaluation report. Given the limited potential for subsurface archaeological data to be present at the remaining historical archaeological sites, which primarily include above-ground features from the mid to late 19th and early 20th century ranching occupation (i.e. foundations, fence lines, wells, windmills, corrals, mine shafts, etc ...) , the Navy's archaeological report will also include a comprehensive historic, rural landscape evaluation of the remaining historic archaeological resources that were not tested.

The Navy expects that we will be beginning consultation on a draft Phase II archaeological evaluation report in late February.

Identification and Evaluation of Historic Resources

In 2009, the Navy conducted an updated evaluation of historic resources in the Inland Area proposed for transfer. The 2009 "(DRAFT) *UPDATE REPORT*- Historic Building Inventory and Evaluation, Concord Naval Weapons Station, Contra Costa County, California" (JRP Historical Consulting Services, 2009) provided an update to prior historic evaluations (William Self Associates, 1993; JRP Historical Consulting Services, 1998). The report inventoried and evaluated 422 buildings and structures and concludes that none meet the criteria for listing in the NRHP. In order to finalize the evaluation of historic resources, the Navy has field verified the 2009 Draft and prepared the enclosed Draft Historic Evaluation Report (December 2012) for consulting party input.

Plans for Future Consultation

The Navy re-engaged Section 106 consultation with SHPO and interested parties at a consultation meeting on November 8, 2012. At this initial meeting, the Navy described its undertaking (transfer), provided an overview of plans for future consultation on draft historic resources and archaeological resource reports, and identified interested consulting parties. The Navy may identify additional interested parties through the public participation components of the National Environmental Policy Act (NEPA) process. The next step in the ongoing consultation is Navy's consideration of consulting party input on the enclosed Draft Historic Evaluation Report.

Draft Historic Evaluation Report: Now Seeking Input

The enclosed Draft Historic Evaluation Report aims to identify whether there are historic buildings or structures located within the Area of Potential Effect (APE) (Inland Area of the former NWS Concord proposed for transfer). The enclosed Draft Historic Evaluation Report provides an update to two previous Navy evaluation reports: one for World War II-era buildings and structures (Self and Associates, 1993) and one for Cold War-era resources (JRP, 1998). Taken together, the Self and Associates and JRP evaluations concluded that none of the Navy's buildings or structures within the Inland Area were

eligible for the NRHP. The Navy consulted on these studies and received SHPO concurrence on both in the 1990s. The enclosed Draft Historic Evaluation Report re-affirms the findings of the two previous studies and confirms that the passage of time has not affected the eligibility status of resources that were less than 50 years of age at the time of their initial evaluation. Overall, the enclosed Draft Historic Evaluation Report concludes that none of the 422 historic buildings or structures evaluated is eligible for listing in the National Register of Historic Places (NRHP) or the California Register of Historic Resources (CRHR), either individually or as part of a historic district.

The evaluation of NRHP/CRHR eligibility for buildings and structures within the APE is included in Chapter 4 of the enclosed report, with overall conclusions provided at the end of that chapter. Department of Parks Recreation (DPR) 523 site forms in Appendix B record the resources and provide resource-specific evaluations of NRHP/CRHR eligibility. Similar resources are grouped together by function or by general area on these DPR 523 site forms. Appendix A, Table 1 can assist the reader in identifying DPR 523 site forms of interest: Table 1 provides a list of all evaluated resources by Navy Building Number / Function and indicates which DPR 523 form addresses each resource. Appendix B then contains a large-format map of the APE/Inland Area, followed by the DPR 523 forms in alphabetical order by Resource Name (located in the top right corner of the form).

Additionally, it is important to note that the Contra Costa Canal (including its subsidiary, the Clayton Canal) is located within the APE and is a historic property eligible for the NRHP/CRHR as determined by consensus with SHPO on March 9, 2005 (SHPO Reference: FHWA050131A). Portions of the Contra Costa Canal and Clayton Canal are located within the Navy's APE and are resources owned by the US Bureau of Reclamation and operated by the Contra Costa Water District. Therefore, the Navy is inviting the USBR and CCWD to participate in this Section 106 consultation. The enclosed Historic Evaluation Report evaluates bridges and culverts associated with the Contra Costa Canal, but the Navy's report does not re-evaluate the Contra Costa Canal or Clayton Canal. Additionally, the enclosed

5090
Ser BPMOW.els/0049B
JAN 3 0 2013

evaluation report also appears to have evaluated bridges over the canals in the Inland Area that may be owned or operated by USBR and CCWD. In coordination with USBR and CCWD in 2009, our Navy real estate team identified eight Navy-owned bridges along the canals, with other bridges assumed to be owned by USBR/CCWD (Enclosure (4)). The Navy's finding on all evaluated bridges and culverts is not eligible for the NRHP or CRHR. The bridges and culverts are evaluated on the "CCC/Clayton Canal Bridges & Culverts" DPR 523 Form in Appendix B.

We respectfully request your input on the findings of the enclosed report within 30 days, or **by no later than March 1, 2013.** You will soon receive an email providing an electronic version of a "consulting party comment form." To expedite our response to comments, we respectfully request that you submit your organization's comments on the comment form and via email to Ms. Erica Spinelli (erica.spinelli@navy.mil) by March 1, 2013.

Should you have any questions or need additional information, please contact Ms. Erica Spinelli , Senior Cultural Resources Manager, at (619) 532-0980 or by email at erica.spinelli@navy.mil.

Sincerely,

KIMBERLY A. OSTROWSKI
Base Closure Manager

Kimberly A. Ostrowski
Acting Base Closure Manager
1455 Frazee Road, Suite 900
San Diego, CA 92108

RE: Base Realignment and Closure Transfer, Naval Weapons Station Seal Beach Detachment Concord, Contra Costa County, CA

Dear Ms. Ostrowski:

Thank you for consulting with me. You do so on behalf of the United States Navy (NAVY) in an effort to comply with Section 106 of the National Historic Preservation Act of 1966, as amended. You are requesting I concur with a number of Determinations of Eligibility related to the proposed Base Realignment and Closure (BRAC) transfer at Naval Weapons Station Seal Beach Detachment Concord (Detachment Concord).

The Navy is in the process of transferring Detachment Concord out of Federal ownership through the BRAC program. In support of this undertaking, you have provided the following study:

- *Draft: Historic Building Inventory and Evaluation Update Report, Inland Area, Concord Naval Weapons Station, Contra Costa County, California* (JRP Historical Consulting, LLC: December 2012)

The Draft Historic Evaluation Report provides an update to two previous Navy evaluation reports: one for World War II-era buildings and structures (Self and Associates, 1993) and one for Cold War-era resources (JRP, 1998). The evaluations concluded that none of the Navy's buildings or structures within the Inland Area was eligible for listing on the National Register of Historic Places (NRHP). The Navy consulted with and received concurrence from the State Historic Preservation Officer in the 1990s. The Draft Historic Evaluation Report re-affirms the findings of the previous studies and confirms that the passage of time has not affected the eligibility status of resources that were less than fifty years of age at the time of their initial evaluation. Overall, the Report concludes that none of the 422 historic buildings or structures is eligible for listing on the NRHP or the California Register of Historic Resources, either individually or as part of a historic district (see attached list).

You define the Area of Potential Effects (APE) for this undertaking as the inland area of Detachment Concord. You also note that portions of the National Register eligible Contra Costa Canal and Clayton Canal are located with the APE. The Draft Historic

Evaluation Report evaluates the bridges and culverts associated with the Contra Costa Canal, but the Navy's report does not re-evaluate the canals.

Having reviewed your submittal, I have the following comments:

1) I have no objection to the your delineation of the APE;

2) I concur that the 422 resources evaluated in the Draft Historic Evaluation Report are ineligible for listing on the NRHP under Criteria A, B, and C for the reasons outlined on Pages 10-14 of the report;

3) Please be reminded that in the event of a change in project description or an inadvertent discovery, you may have additional responsibilities under 36 CFR Part 800.

Thank you for seeking my comments and considering historic properties as part of your project planning. If you have any questions or concerns, please contact Tristan Tozer of my staff at (916) 445-7027 or at email at Tristan.Tozer@parks.ca.gov.

Sincerely,

Susan K Stratton for

Program Management Office West
1455 Frazee Road, Suite 900
San Diego, CA 92108

RE: Base Realignment and Closure Transfer, Naval Weapons Station Seal Beach Detachment Concord, Contra Costa County, CA

Dear Mr. Lee:

Thank you for consulting with me. You do so on behalf of the United States Navy (NAVY) in an effort to comply with Section 106 of the National Historic Preservation Act of 1966, as amended. You are requesting I concur with a number of Determinations of Eligibility related to the proposed Base Realignment and Closure (BRAC) transfer at Naval Weapons Station Seal Beach Detachment Concord (Detachment Concord).

The Navy is in the process of transferring Detachment Concord out of Federal ownership through the BRAC program. In our previous round of consultation I concurred that 442 historic resources evaluated as part of the transfer of Detachment Concord were eligible for listing on the National Register of Historic Places (NRHP). I also had no issues with your delineation of the Project's Area of Potential Effects (APE).

Since this time the Navy has prepared a Draft Archaeological Evaluation Report. The report aims to identify whether there are National Register-eligible archeological sites located within the APE. The results of these investigations are summarized in the following report:

- *National Register of Historic Places Evaluation of 21 Archaeological Sites in Support of the Environmental Impact Statement for Disposal and Reuse of the Former Naval Weapons Station, Seal Beach, Detachment Concord, Contra Costa County, California* (ASM Affiliates, Inc.: November 2013)

This study builds on the findings of a 2008 intensive pedestrian survey of the Detachment Concord Inland Area. The report concludes that sites CCO-680 and P-861 are eligible for listing on the NRHP; CCO-680 under Criterion D and P-861 under Criteria A and D. The remaining nineteen sites have been evaluated as ineligible for listing on the NRHP (see the attached chart for a complete list of evaluated resources). The evaluation also concludes that there are no identified rural historic landscapes,

traditional cultural properties (TCPs), or traditional cultural landscapes (TCLs) located with the APE that meet the criteria for listing on the NRHP.

Having reviewed your submittal, I have the following comments:

1) I concur that archaeological sites CCO-680 and P-861 are eligible for listing on the NRHP under the above-listed National Register Criteria. However, as P-861 is completely within the boundary of CC-680, shouldn't they be considered one multi-component site?

2) I further concur that the remaining nineteen resources are ineligible for listing on the NRHP under any applicable criteria;

3) I agree that there are no rural historic landscapes, TCPs, or TCLs within the APE that meet the criteria for listing on the NRHP;

4) Please be reminded that in the event of a change in project description or an inadvertent discovery, you may have additional responsibilities under 36 CFR Part 800.

Thank you for seeking my comments and considering historic properties as part of your project planning. I look forward to further consultation with you on the transfer of this property. If you have any questions or concerns, please contact Tristan Tozer of my staff at (916) 445-7027 or at email at Tristan.Tozer@parks.ca.gov.

Sincerely,

Carol Roland-Nawi, Ph.D.

MAR 3 2014

Mr. Tristan Tozer
California Department of Parks and Recreation
Office of Historic Preservation (OHP)
1725 23rd Street, Suite 100
Sacramento, CA 95816

Dear Mr. Tozer:

This letter continues consultation under Section 106 of National Historic Preservation Act (NHPA) regarding the Navy's proposed Base Realignment and Closure (BRAC) transfer of Federal property at the former Naval Weapons Station Seal Beach (NWSSB) Detachment Concord ("former NWS Concord," hereafter), located in Contra Costa County, California (SHPO Reference: USN070813A). Enclosed with this letter is the Final Archaeological Evaluation Report, which finalizes the Navy's identification of historic properties efforts under 36 CFR 800.4. This letter additionally documents the Navy's finding of adverse effect under 36 CFR 800.5 and proposes a March 26, 2014 consultation meeting to begin consultation regarding a Section 106 Memorandum of Agreement (MOA).

As more thoroughly described in prior correspondence, the Navy is proposing to transfer the remaining portion of the "Inland Area" of the former NWS Concord out of Federal ownership. This property transfer comprises the Navy's undertaking under Section 106 and the Area of Potential Effects (APE) is the approximately 5,032-acre portion of surplus property proposed for transfer. The City of Concord is the designated Local Reuse Authority (LRA) and proposed, primary property recipient. The City of Concord proposes reuse of this property consistent with its *Concord Reuse Project Area Plan* (2012).

Identification of Historic Properties Efforts Complete (36 CFR 800.4)

In January 2013, the Navy began consultation on a draft Historic Evaluation Report with the Office of Historic Preservation (OHP) and other consulting parties. The Historic Evaluation Report concluded that none of the 422 historic

buildings or structures evaluated is eligible for listing in the National Register of Historic Places (NRHP), either individually or as part of a historic district. The Navy received OHP concurrence on the findings of the Historic Evaluation Report on February 14, 2013.

In November 2013, the Navy began consultation with the OHP and interested consulting parties on the *Draft National Register of Historic Places Evaluation of 21 Archaeological Sites in Support of the Environmental Impact Statement for Disposal and Reuse of the Former Naval Weapons Station, Seal Beach, Detachment Concord, Contra Costa County, California* (November, 2013) ("Draft Archaeological Evaluation Report," hereafter). Although consulting parties provided comments, there were no objections to the Navy's NRHP eligibility findings. The Navy received OHP concurrence on the findings of the Draft Archaeological Evaluation Report on January 23, 2014. Therefore, the Navy's findings remain unchanged from the draft report: Sites CCO-680 and P-861 are eligible for listing in the National Register of Historic Places (NRHP), and there are no identified rural historic landscapes, Traditional Cultural Properties, or Traditional Cultural Landscapes located within the APE that meet the criteria for listing in the NRHP. Enclosed is a CD containing the Final Archaeological Evaluation Report, and hard copy page replacements for insertion into the previously-provided hard copy of the Draft report. Page replacements/insertions include Appendix I- Section 106 Consultation Record which contains the Navy's responses to all comments received and copies of consultation correspondence.

Finding of Adverse Effect (36 CFR 800.5)

As a result of the above identification efforts, the Navy has identified two historic properties eligible for the NRHP (prehistoric archaeological sites CA-CCO-680 and P-861) that are subject to the Navy's proposed transfer of property out of Federal ownership. Without "adequate and legally enforceable restrictions or conditions to ensure long-term preservation of these properties' historic significance," transfer of these properties out of Federal ownership would be considered an adverse effect under 36 CFR 800.5(2)(vii). Additionally, it is

reasonably-foreseeable that reuse of the surplus property consistent with the City of Concord's *Concord Reuse Project Area Plan* (2012) may also adversely affect historic properties.

In accordance with 36 CFR 800.5 and through the analysis above, the Navy has applied the criteria of adverse effect and finds that the Navy's proposed undertaking, and the subsequent reuse of the surplus property by other property owners, has the potential to result in adverse effects to historic properties.

Consultation Meeting to Develop a Section 106 Memorandum of Agreement

In accordance with 36 CFR 800.6, the Navy is proposing a meeting with interested consulting parties to begin consultation regarding the resolution of adverse effects. The goal of the meeting will be to discuss means to avoid, minimize, and mitigate potential adverse effects to historic properties. The Navy is proposing a Section 106 Memorandum of Agreement (MOA) and is seeking consulting party input on its content.

Section 106 Consultation Meeting re Former NWS Concord
Wednesday, March 26, 2014
10:00 AM to 1:00 PM

MAR 3 2014

Dear Consulting Parties:

This letter continues consultation under Section 106 of National Historic Preservation Act (NHPA) regarding the Navy's proposed Base Realignment and Closure (BRAC) transfer of Federal property at the former Naval Weapons Station Seal Beach (NWSSB) Detachment Concord ("former NWS Concord," hereafter), located in Contra Costa County, California. Enclosed with this letter is the Final Archaeological Evaluation Report, which finalizes the Navy's identification of historic properties efforts under 36 CFR 800.4. This letter additionally documents the Navy's finding of adverse effect under 36 CFR 800.5 and proposes a March 26, 2014 consultation meeting to begin consultation regarding a Section 106 Memorandum of Agreement (MOA).

As more thoroughly described in prior correspondence, the Navy is proposing to transfer the remaining portion of the "Inland Area" of the former NWS Concord out of Federal ownership. This property transfer comprises the Navy's undertaking under Section 106 and the Area of Potential Effects (APE) is the approximately 5,032-acre portion of surplus property proposed for transfer. The City of Concord is the designated Local Reuse Authority (LRA) and proposed, primary property recipient. The City of Concord proposes reuse of this property consistent with its *Concord Reuse Project Area Plan* (2012).

Identification of Historic Properties Efforts Complete (36 CFR 800.4)

In January 2013, the Navy began consultation on a draft Historic Evaluation Report with the Office of Historic Preservation (OHP) and other consulting parties. The Historic Evaluation Report concluded that none of the 422 historic buildings or structures evaluated is eligible for listing in the National Register of Historic Places (NRHP), either individually or as part of a historic district. The Navy received OHP concurrence on the findings of the Historic Evaluation Report on February 14, 2013.

In November 2013, the Navy began consultation with the OHP and interested consulting parties on the *Draft National Register of Historic Places Evaluation of 21 Archaeological Sites in Support of the Environmental Impact Statement for Disposal and Reuse of the Former Naval Weapons Station, Seal Beach, Detachment Concord, Contra Costa County, California* (November, 2013) ("Draft Archaeological Evaluation Report," hereafter). Although consulting parties provided comments, there were no objections to the Navy's NRHP eligibility findings. The Navy received OHP concurrence on the findings of the Draft Archaeological Evaluation Report on January 23, 2014. Therefore, the Navy's findings remain unchanged from the draft report: Sites CCO-680 and P-861 are eligible for listing in the National Register of Historic Places (NRHP), and there are no identified rural historic landscapes, Traditional Cultural Properties, or Traditional Cultural Landscapes located within the APE that meet the criteria for listing in the NRHP. Enclosed is a CD containing the Final Archaeological Evaluation Report. For those parties previously receiving a hard copy of the Draft report, hard copy page replacements are also included with this correspondence. Page replacements/insertions include Appendix I- Section 106 Consultation Record which contains the Navy's responses to all comments received and copies of consultation correspondence.

Finding of Adverse Effect (36 CFR 800.5)

As a result of the above identification efforts, the Navy has identified two historic properties eligible for the NRHP (prehistoric archaeological sites CA-CCO-680 and P-861) that are subject to the Navy's proposed transfer of property out of Federal ownership. Without "adequate and legally enforceable restrictions or conditions to ensure long-term preservation of these properties' historic significance," transfer of these properties out of Federal ownership would be considered an adverse effect under 36 CFR 800.5(2)(vii). Additionally, it is reasonably-foreseeable that reuse of the surplus property consistent with the City of Concord's *Concord Reuse Project Area Plan* (2012) may also adversely affect historic properties.

5090
Ser BPMOW.els/0076
MAR 3 2014

In accordance with 36 CFR 800.5 and through the analysis above, the Navy has applied the criteria of adverse effect and finds that the Navy's proposed undertaking, and the subsequent reuse of the surplus property by other property owners, has the potential to result in adverse effects to historic properties.

Consultation Meeting to Develop a Section 106 Memorandum of Agreement

In accordance with 36 CFR 800.6, the Navy is proposing a meeting with interested consulting parties (listed in Enclosure 2) to begin consultation regarding the resolution of adverse effects. The goal of the meeting will be to discuss means to avoid, minimize, and mitigate potential adverse effects to historic properties. The Navy is proposing a Section 106 Memorandum of Agreement (MOA) and is seeking your input on its content. We request your participation for the following consultation meeting:

Section 106 Consultation Meeting re Former NWS Concord
Wednesday, March 26, 2014
10:00 AM to 1:00 PM
Community Meeting Room
City of Concord Police Department
1350 Galindo Street
Concord, CA 94520

Please email Ms. Erica Spinelli at erica.spinelli@navy.mil to indicate your participation in the meeting.

Sincerely,

Alan K. Lee

Ms. Kelly Fanizzo
Advisory Council on Historic Preservation
1100 Pennsylvania Avenue, NW, Suite 803
Old Post Office Building
Washington, DC 20004

Dear Ms. Fanizzo:

This purpose of this letter is to notify the Advisory Council on Historic Preservation (ACHP) of an adverse effect finding regarding the Navy's proposed Base Realignment and Closure (BRAC) transfer of Federal property at the former Naval Weapons Station Seal Beach (NWSSB) Detachment Concord ("former NWS Concord," hereafter), located in Contra Costa County, California (SHPO Reference: USN070813A). This letter summarizes the Navy's identification of historic properties efforts under 36 CFR 800.4, documents the Navy's finding of adverse effect under 36 CFR 800.5, and proposes a Section 106 Memorandum of Agreement (MOA).

The Navy is proposing to transfer the remaining portion of the "Inland Area" of the former NWS Concord out of Federal ownership. This property transfer comprises the Navy's undertaking under Section 106 and the Area of Potential Effects (APE) is the approximately 5,032-acre portion of surplus property proposed for transfer. The City of Concord is the designated Local Reuse Authority (LRA) and proposed, primary property recipient. The City of Concord proposes reuse of this property consistent with its *Concord Reuse Project Area Plan* (2012). The 2012 *Area Plan* is available online at **http://www.concordreuseproject.org/library/** and a diagram of the *Area Plan*'s proposed land uses is provided as an enclosure. The City of Concord also certified a California Environmental Quality Act (CEQA) Final Environmental Impact Report (EIR) Addendum on the Area Plan in 2012.

Identification of Historic Properties Efforts Complete (36 CFR 800.4)

In January 2013, the Navy began consultation on a draft Historic Evaluation Report with the Office of Historic Preservation (OHP) and other consulting parties. The Historic

Evaluation Report concluded that none of the 422 historic buildings or structures evaluated is eligible for listing in the National Register of Historic Places (NRHP), either individually or as part of a historic district. The Navy received OHP concurrence on the findings of the Historic Evaluation Report on February 14, 2013.

In November 2013, the Navy began consultation with the OHP and interested consulting parties on the *Draft National Register of Historic Places Evaluation of 21 Archaeological Sites in Support of the Environmental Impact Statement for Disposal and Reuse of the Former Naval Weapons Station, Seal Beach, Detachment Concord, Contra Costa County, California* (November, 2013) ("Draft Archaeological Evaluation Report," hereafter). Although consulting parties provided comments, there were no objections to the Navy's NRHP eligibility findings. The Navy received OHP concurrence on the findings of the Draft Archaeological Evaluation Report on January 23, 2014. Therefore, the Navy's findings remain unchanged from the draft report: Sites CA-CCO-680 and P-861 are eligible for listing in the National Register of Historic Places (NRHP), and there are no identified rural historic landscapes, Traditional Cultural Properties, or Traditional Cultural Landscapes located within the APE that meet the criteria for listing in the NRHP.

Summary of Historic Properties Identified Within the APE

Site CA-CCO 680 is a prehistoric archaeological site located near the intersection of East Olivera and Willow Pass Roads. Site CCO-680 appears to represent a remnant of a once more substantial burial and habitation locality spanning from 500 B.C. to 1800 A.D. Prehistoric cultural materials at Site CCO-680 are both horizontally and vertically extensive, reflecting a fairly complex depositional history. Surface materials are widely distributed (280 N-S x 175 m E-W) but occur primarily within an artifact concentration roughly 90 m in diameter. The surface of the artifact concentration contains flaked stone tools, ground stone tools, shell artifacts, faunal bone, shell detritus, and human remains, while surfaces beyond this area mainly yielded much lower artifact densities of these materials. Exploratory excavations confirmed these differences, finding a rich, deep midden deposit inside the artifact concentration but only a thin layer of redistributed midden matrix around the periphery of the artifact concentration within

the plow zone. Human remains are also present throughout the cultural deposit, consisting of highly fragmented skeletal elements from all portions of the body.

Site CCO-680 is eligible for NRHP listing under Criterion D as it has the potential to yield important information in two respects. First, CCO-680 has the potential to provide data concerning prehistoric burial/ceremonial practices. The site carries religious/cultural significance with regard to contemporary ethnographic perspectives about death and burial. It is also possible that future studies at Site CCO-680 could provide useful information about the social organization of individuals interred at the site. Contemporary Miwok consultants interpret Site CCO-680 as a burial site due to the presence of human remains, regardless of their condition or location. Evidence for multiple interments at Site CCO-680 potentially reflects repeated use of the site as a cemetery or burial location over an extended period of time. Along these lines, it is also important to consider the data potential of Site CCO-680 with respect to its possible relationship to the previously-identified Site CCO-250 (the Maltby Mound). A more definitive answer regarding the relationship of these sites could potentially be obtained through a comparative analysis between the currently recorded assemblage and the existing artifact collection at U.C. Berkeley. Moreover, if Site CCO-680 does represent the basal layer of Site CCO-250, it could offer additional information regarding the evolution of burial customs from the Middle/Late Transition into the Late Period and to improve our understanding of late prehistoric mortuary and adaptive patterns in central California.

Additionally, site CCO-680 has great data potential under Criterion D with respect to coastal-inland adaptations, obsidian conveyance/exchange networks, settlement systems, subsistence patterns, and many other related issues. Considering the restricted volume of excavated deposits at Site CCO-680 at the time of this study, it is very likely that additional diagnostic artifacts, dateable materials, and subsistence data would still be available from Site CCO-680 through future studies.

Site P-861 is a prehistoric archaeological site located to the east of Mt. Diablo Creek that consists of four rock features (two with multiple bedrock mortars and two with numerous cupules) and a shallow, but horizontally-extensive, midden deposit. Site P-861 appears to have been a short-term residential camp that may have also been utilized for ceremonial

purposes during specific events and likely at different times of year. The site appears to have been occupied between about 1,900 and 300 years ago. From an archaeological standpoint, mortar features such as these are often assumed to represent acorn and other plant food processing, while the cupule rocks may have served either for food processing or ceremonial activities. Limited testing in the midden yielded a small obsidian arrow point fragment, flaked stone tools, pieces of obsidian, chert, and petrified wood debitage, and some vertebrate and invertebrate fauna.

Site P-861 is eligible for NRHP listing under Criterion A and D since it appears to have high data potential with respect to ethnographic and prehistoric research. With respect to Criterion A, the current ethnographic study indicates that Site P-861 was potentially used as a ceremonial location for people living in the Inland Area at NWSSB DET Concord during prehistoric times. If ceremonial, it may have also functioned as a "power" site or a medicine camp where rituals were performed and/or plants used to assist in those rituals were gathered. In its current condition, Site P-861 preserves a group of archaeological remains that exemplifies the use of certain "special" sites for both ceremonial and utilitarian purposes and provides some insight to how prehistoric people may have conceptualized and divided the use of ritual and living space. The importance of Site P-861 with respect to events in prehistory is measured by the significance attributed to the ceremonial events that likely took place there by the Miwok consultants.

With respect to Criterion D, Site P-861 has the potential to yield important archaeological data regarding prehistoric chronology, settlement, and subsistence. Obsidian studies have facilitated an estimate of site age and offer a glimpse of lithic material conveyance patterns and reflect the spatial extent of regional settlement and exchange systems. Mortar features and subsistence remains provide insight as to the types and locations of environments used by site occupants and, by extension, of how people made seasonal use of inland and coastal landscapes in western Contra Costa County. It is possible that further archaeological work at Site P-861 could recover additional cultural materials to solidify site chronology, test current hypotheses, and examine other local and regional research issues concerning the prehistory of NWSSB DET Concord. As bedrock milling elements are rare in this area, future research such as residue studies could provide significant

additional data for understanding the function of these features along with a better understanding of site function.

The **Contra Costa Canal** (including its subsidiary, the Clayton Canal) is located within the Navy's APE and is a historic property eligible for the NRHP as determined by consensus with SHPO on March 9, 2005 (SHPO Reference: FHWA050131A). Portions of the Contra Costa Canal and Clayton Canal are located within the Navy's APE and are resources owned by the US Bureau of Reclamation and operated by the Contra Costa Water District. The Canals are not subject to the Navy property transfer.

Finding of Adverse Effect (36 CFR 800.5)

As a result of the above identification efforts, the Navy has identified two historic properties eligible for the NRHP (prehistoric archaeological sites CA-CCO-680 and P-861) that are subject to the Navy's proposed transfer of property out of Federal ownership. Without "adequate and legally enforceable restrictions or conditions to ensure long-term preservation of these properties' historic significance," transfer of these properties out of Federal ownership would be considered an adverse effect under 36 CFR 800.5(2)(vii). Additionally, it is reasonably-foreseeable that reuse of the surplus property consistent with the City of Concord's *Concord Reuse Project Area Plan* (2012) may also adversely affect historic properties.

The *Area Plan* proposes the following land uses in the vicinity of each historic property. **CA-CCO-680** is located within an area proposed for "Greenways, Citywide Parks, and Tournament Facilities." **P-861** is located within an area proposed for "Conservation Open Space" and a regional park. Although redevelopment is proposed for the areas surrounding the **Contra Costa Canal**, no direct effects to the Canals are proposed in the *Area Plan*.

In accordance with 36 CFR 800.5 and through the analysis above, the Navy has applied the criteria of adverse effect and finds that the Navy's proposed undertaking, and the subsequent reuse of the surplus property by other property owners, has the potential to result in adverse effects to historic properties.

Consultation Meeting to Develop a Section 106 Memorandum of Agreement

In accordance with 36 CFR 800.6, the Navy is proposing a meeting with interested consulting parties to begin consultation regarding the resolution of adverse effects. The goal of the meeting will be to discuss means to avoid, minimize, and mitigate potential adverse effects to historic properties. The Navy is proposing a Section 106 Memorandum of Agreement (MOA) and is seeking consulting party input on its content.

Section 106 Consultation Meeting re Former NWS Concord
Wednesday, March 26, 2014
10:00 AM to 1:00 PM
Community Meeting Room
City of Concord Police Department
1350 Galindo Street
Concord, CA 94520

As discussed on February 28, 2014, the Navy will follow up with you after this meeting to discuss whether the ACHP will participate in the consultation.

Sincerely,

Alan K. Lee

MAR 5 2014

Mr. Troy Burdick
Superintendent
Central California Agency
Bureau of Indian Affairs
650 Capitol Mall, Suite 8-500
Sacramento, California 95814

Dear Mr. Burdick:

We received your letter dated December 31, 2013 (Forestry 4401-P5) regarding a proposed meeting concerning the Ione Band of Miwok Indians' and California Indian Water Commission's interest in the former Naval Weapons Station, Concord. As requested, our staff contacted the Bureau of Indian Affairs' (BIA) Central California Agency Real Estate Department to discuss and schedule the proposed meeting. The Real Estate Department referred us to Mr. Gerald Jones, Assistant Regional Forester, for additional information. After several attempts to reach your staff, we have been unsuccessful in further discussing BIA's interest and the prospective meeting agenda. Should the BIA's interest involve the treatment of National Register of Historic Places (NRHP)-eligible resources at NWS Concord, we invite your agency's participation in Navy's March 26, 2014 Section 106 consultation meeting. Additional background on the current status of the proposed BRAC property transfer is described below.

By email correspondence with Mr. Jones dated January 27, 2014, the Navy summarized the current status of the BRAC process at Concord. The former NWS Concord was identified for BRAC closure in 2005 and, as required by BRAC regulations, the Navy solicited for Federal Agency interest by means of correspondence and Federal Register notice on January 17, 2006. After identification of the Federal Agency transferee (the United States Coast Guard was the only responding agency), the City of Concord (City), as the Local Reuse Authority (LRA), conducted surplus screening for approximately 5,032 acres in 2007. Under the surplus screening process, the City receives and reviews applications for the property for those agencies interested in public benefit conveyances, and incorporates the approved applicants into its reuse plan. As a result of a 6-year local

planning process, the City finalized its reuse plan (the Concord Reuse Project Area Plan or "Area Plan") and certified a California Environmental Quality Act Environmental Impact Report for the Area Plan in 2012. The Navy is proposing to transfer a total of approximately 5,032 acres of "surplus" property in the Inland Area of the former Naval Weapons Station Concord to the City, as well as to the Department of Interior (for East Bay Regional Parks District (EBRPD)) in accordance with the Area Plan.

To support the proposed property transfers to the City of Concord and EBRPD, the Navy is currently in the process of complying with Section 106 of the National Historic Preservation Act. The Navy has recently completed consultation regarding the identification of historic properties. The State Historic Preservation Officer has concurred with the Navy's 2013 basewide historic resources evaluation (no historic resources identified), and with the 2013 Phase II archaeological evaluation report (which identifies prehistoric archaeological sites CA-CCO-680 and P-861 as eligible for the NRHP). The Navy previously consulted with the Ione Band, California Valley Miwok Tribe, and Shingle Springs Band of Miwok Indians under Native American Graves Protection and Repatriation Act (NAGPRA) and tribal representatives participated in the archaeological fieldwork and provided ethnographic input to our evaluation report. We anticipate that these Tribes will continue consultation with Navy to identify ways to avoid, minimize, and mitigate the potentially-adverse effects of the proposed transfers and reuse on sites CA-CCO-680 and P-861. The enclosure provides the Navy's Section 106 finding of adverse effect and proposes a consultation meeting on March 26, 2014 from 10:00am to 1:00pm in Concord, California to begin consultation on a Section 106 Memorandum of Agreement (MOA). We welcome BIA participation in this meeting.

Other BIA or Tribal proposals regarding land use after Navy transfer, such as natural resources stewardship or land management partnerships, should be separately coordinated with the LRA (City of Concord) because the Navy will not have a long-term land management or oversight role at the former installation.

5090
Ser BPMOW.els/0082
MAR 5 2014

Please advise as to whether the BIA plans to participate in the Section 106 consultation meeting. The point of contact regarding Section 106 is Ms. Erica Spinelli, NEPA Planner / Senior Cultural Resources Manager at erica.spinelli@navy.mil and 619-532-0980.

Sincerely,

Alan K. Lee

5090 – Ser BPMOW/0078

Dear Mr. Lee:

The Advisory Council on Historic Preservation (ACHP) recently received your notification and supporting documentation regarding the adverse effects of the referenced undertaking on properties listed on and eligible for listing in the National Register of Historic Places. Based upon the information you provided, we have concluded that Appendix A, *Criteria for Council Involvement in Reviewing Individual Section 106 Cases,* of our regulations, "Protection of Historic Properties" (36 CFR Part 800) does not apply to this undertaking. Accordingly, we do not believe that our participation in the consultation to resolve adverse effects is needed. However, if we receive a request for participation from the State Historic Preservation Officer, Tribal Historic Preservation Officer, or another party, we may reconsider this decision. Additionally, should circumstances change, and you determine that our participation is needed to conclude the consultation process, please notify us.

Pursuant to 36 CFR 800.6(b)(1)(iv), you will need to file the final Memorandum of Agreement (MOA), developed in consultation with the California State Historic Preservation Officer (SHPO) and any other consulting parties, and related documentation with the ACHP at the conclusion of the consultation process. The filing of the Agreement and supporting documentation with the ACHP is required in order to complete the requirements of Section 106 of the National Historic Preservation Act.

Thank you for providing us with your notification of adverse effect. If you have any questions or require further assistance, please contact Kelly Fanizzo at 202-606-8507, or via email at kfanizzo@achp.gov.

Sincerely,

Raymond V. Wallace

October 15, 2014

Ms. Erica Spinelli
NEPA Project Manager
NAVFAC BRACPMO West
1455 Frazee Road, Suite 900
San Diego, CA 92108-4310

Ref: Disposal and Reuse of the Former Naval Weapons Station Seal Beach, Detachment Concord Contra Costa, California

Dear Ms. Spinelli:

On October 9, 2014, the Advisory Council on Historic Preservation (ACHP) received your notification for public meetings for the Draft Environmental Impact Statement for the referenced project. This notification was sent in compliance with the National Environmental Policy Act (NEPA). We have no comments or plans to become a Cooperating Agency pursuant to NEPA, at this time.

Section 106 of the National Historic Preservation Act instructs the federal agency to take into account the effect of an undertaking on any property that is eligible for or listed in the National Register of Historic Places "prior to the approval of the expenditure of any Federal funds on the undertaking or prior to the issuance of any license." 16 U.S.C. § 470f (emphasis added). This statutory language makes it clear that a federal agency must complete its Section 106 responsibilities before ("prior to") reaching its final decision ("approval," "issuance") on an undertaking.

According to the Council on Environmental Quality's regulations, a Record of Decision (ROD) "shall state … what the decision was … [and] … whether all practicable means to avoid or minimize environmental harm from the alternative selected have been adopted, and if not, why they were not." 40 C.F.R. § 1502.2 (emphasis added). Accordingly, the issuance of a ROD conveys the agency's final decision on an undertaking and details the nature of that decision.

In order to meet the statutory and regulatory requirements of the Section 106 process, the ROD should be issued concurrent with or after the completion of the Section 106 process. As you know, the execution of a Section 106 program alternative, such as a Programmatic Agreement, in accordance with the Section 106 regulations indicates that an agency has completed this process.

In April 2014 the ACHP notified Mr. Alan Leewe would not participate in the Section 106 consultation for this reference undertaking. While Naval Facilities Engineering Command, Base Realignment and Closure Program Management Office West should continue Section 106 consultation with the California State Historic Preservation Officer, Indian tribes, and other consulting parties,please remove the ACHP from your NEPA distribution list.

JUL 1 2015

Mr. Tristan Tozer
California Department of Parks and Recreation
Office of Historic Preservation (OHP)
1725 23rd Street, Suite 100
Sacramento, CA 95816

Dear Mr. Tozer:

This letter continues consultation under Section 106 of National Historic Preservation Act (NHPA) regarding the Navy's proposed Base Realignment and Closure (BRAC) transfer of Federal property at the former Naval Weapons Station Seal Beach Detachment Concord ("former NWS Concord," hereafter), located in Contra Costa County, California (SHPO Reference: USN070813A). Enclosed for your review is the Draft Section 106 Memorandum of Agreement (MOA) for the disposal and reuse of the former NWS Concord (Enclosure (1)). We respectfully request OHP's submittal of comments on the Draft MOA **by August 17, 2015.** Via separate correspondence, the Navy is also concurrently seeking and considering the input of the consulting parties identified in the distribution list included in Enclosure (2).

As more thoroughly described in prior correspondence, the Navy is proposing to transfer the remaining portion of the "Inland Area" of the former NWS Concord out of Federal ownership. The Area of Potential Effects (APE) for the Navy's undertaking is the approximately 5,038-acre portion of surplus property proposed for transfer. The City of Concord is the designated Local Reuse Authority (LRA) and proposes reuse of this property consistent with its *Concord Reuse Project Area Plan* (2012). The City of Concord and East Bay Regional Park District are the proposed property recipients for the areas containing the National Register of Historic Places-eligible prehistoric archaeological sites CA-CCO-680 and P-861. Additionally, the United States Army Corps of Engineers (USACE) proposes to make a permit decision pursuant to Section 404 of the Clean Water Act of 1977 (33 U.S.C. § 1344, 2007) to support implementation of the Area Plan and USACE has determined that issuance of a permit to the City constitutes an undertaking under Section 106.

5750
Ser BPMOW.els/0250

JUL 1 2015

The enclosed Draft MOA reflects previous consultation with OHP and the Advisory Council on Historic Preservation, and OHP's recommendation for deed notices to resolve potential adverse effects arising from the Navy's property transfer. This Draft MOA also reflects consulting party input received during the course of consultation, and more specifically, input provided during a consultation meeting held on March 26, 2014.

Based upon written comments received on the Draft MOA, the Navy will continue consultation with interested parties through conference calls or face-to-face meetings as needed. Please let us know whether a conference call or consultation meeting with OHP would support your review and facilitate submittal of comments.

The Navy BRAC Program Management Office (PMO) West is moving offices in mid-July. Effective July 13, 2015, please send all correspondence to:

JUL 1 2015

Dear Consulting Parties:

This letter continues consultation under Section 106 of National Historic Preservation Act (NHPA) regarding the Navy's proposed Base Realignment and Closure (BRAC) transfer of Federal property at the former Naval Weapons Station Seal Beach Detachment Concord ("former NWS Concord," hereafter), located in Contra Costa County, California (SHPO Reference: USN070813A). Enclosed for your review is the Draft Section 106 Memorandum of Agreement (MOA) for the disposal and reuse of the former NWS Concord (Enclosure (1)). We respectfully request submittal of written comments on the Draft MOA **by August 17, 2015.** The Navy is concurrently seeking and considering the input of the consulting parties listed in Enclosure (2) and the California Office of Historic Preservation (OHP).

As more thoroughly described in prior correspondence, the Navy is proposing to transfer the remaining portion of the "Inland Area" of the former NWS Concord out of Federal ownership. The Area of Potential Effects (APE) for the Navy's undertaking is the approximately 5,038-acre portion of surplus property proposed for transfer. The City of Concord is the designated Local Reuse Authority (LRA) and proposes reuse of this property consistent with its *Concord Reuse Project Area Plan* (2012). The City of Concord and East Bay Regional Park District are the proposed property recipients for the areas containing the National Register of Historic Places-eligible prehistoric archaeological sites CA-CCO-680 and P-861. Additionally, the United States Army Corps of Engineers (USACE) proposes to make a permit decision pursuant to Section 404 of the Clean Water Act of 1977 (33 U.S.C. § 1344, 2007) to support implementation of the Area Plan and USACE has determined that issuance of a permit to the City constitutes an undertaking under Section 106.

The enclosed Draft MOA reflects previous consultation with OHP and the Advisory Council on Historic Preservation, and responds to input received from other consulting parties during the course of consultation on this project. Based upon written comments received on the enclosed Draft MOA, the Navy will continue consultation with interested parties through conference calls or face-to-face meetings as needed.

DRAFT DATED JUNE 30, 2015

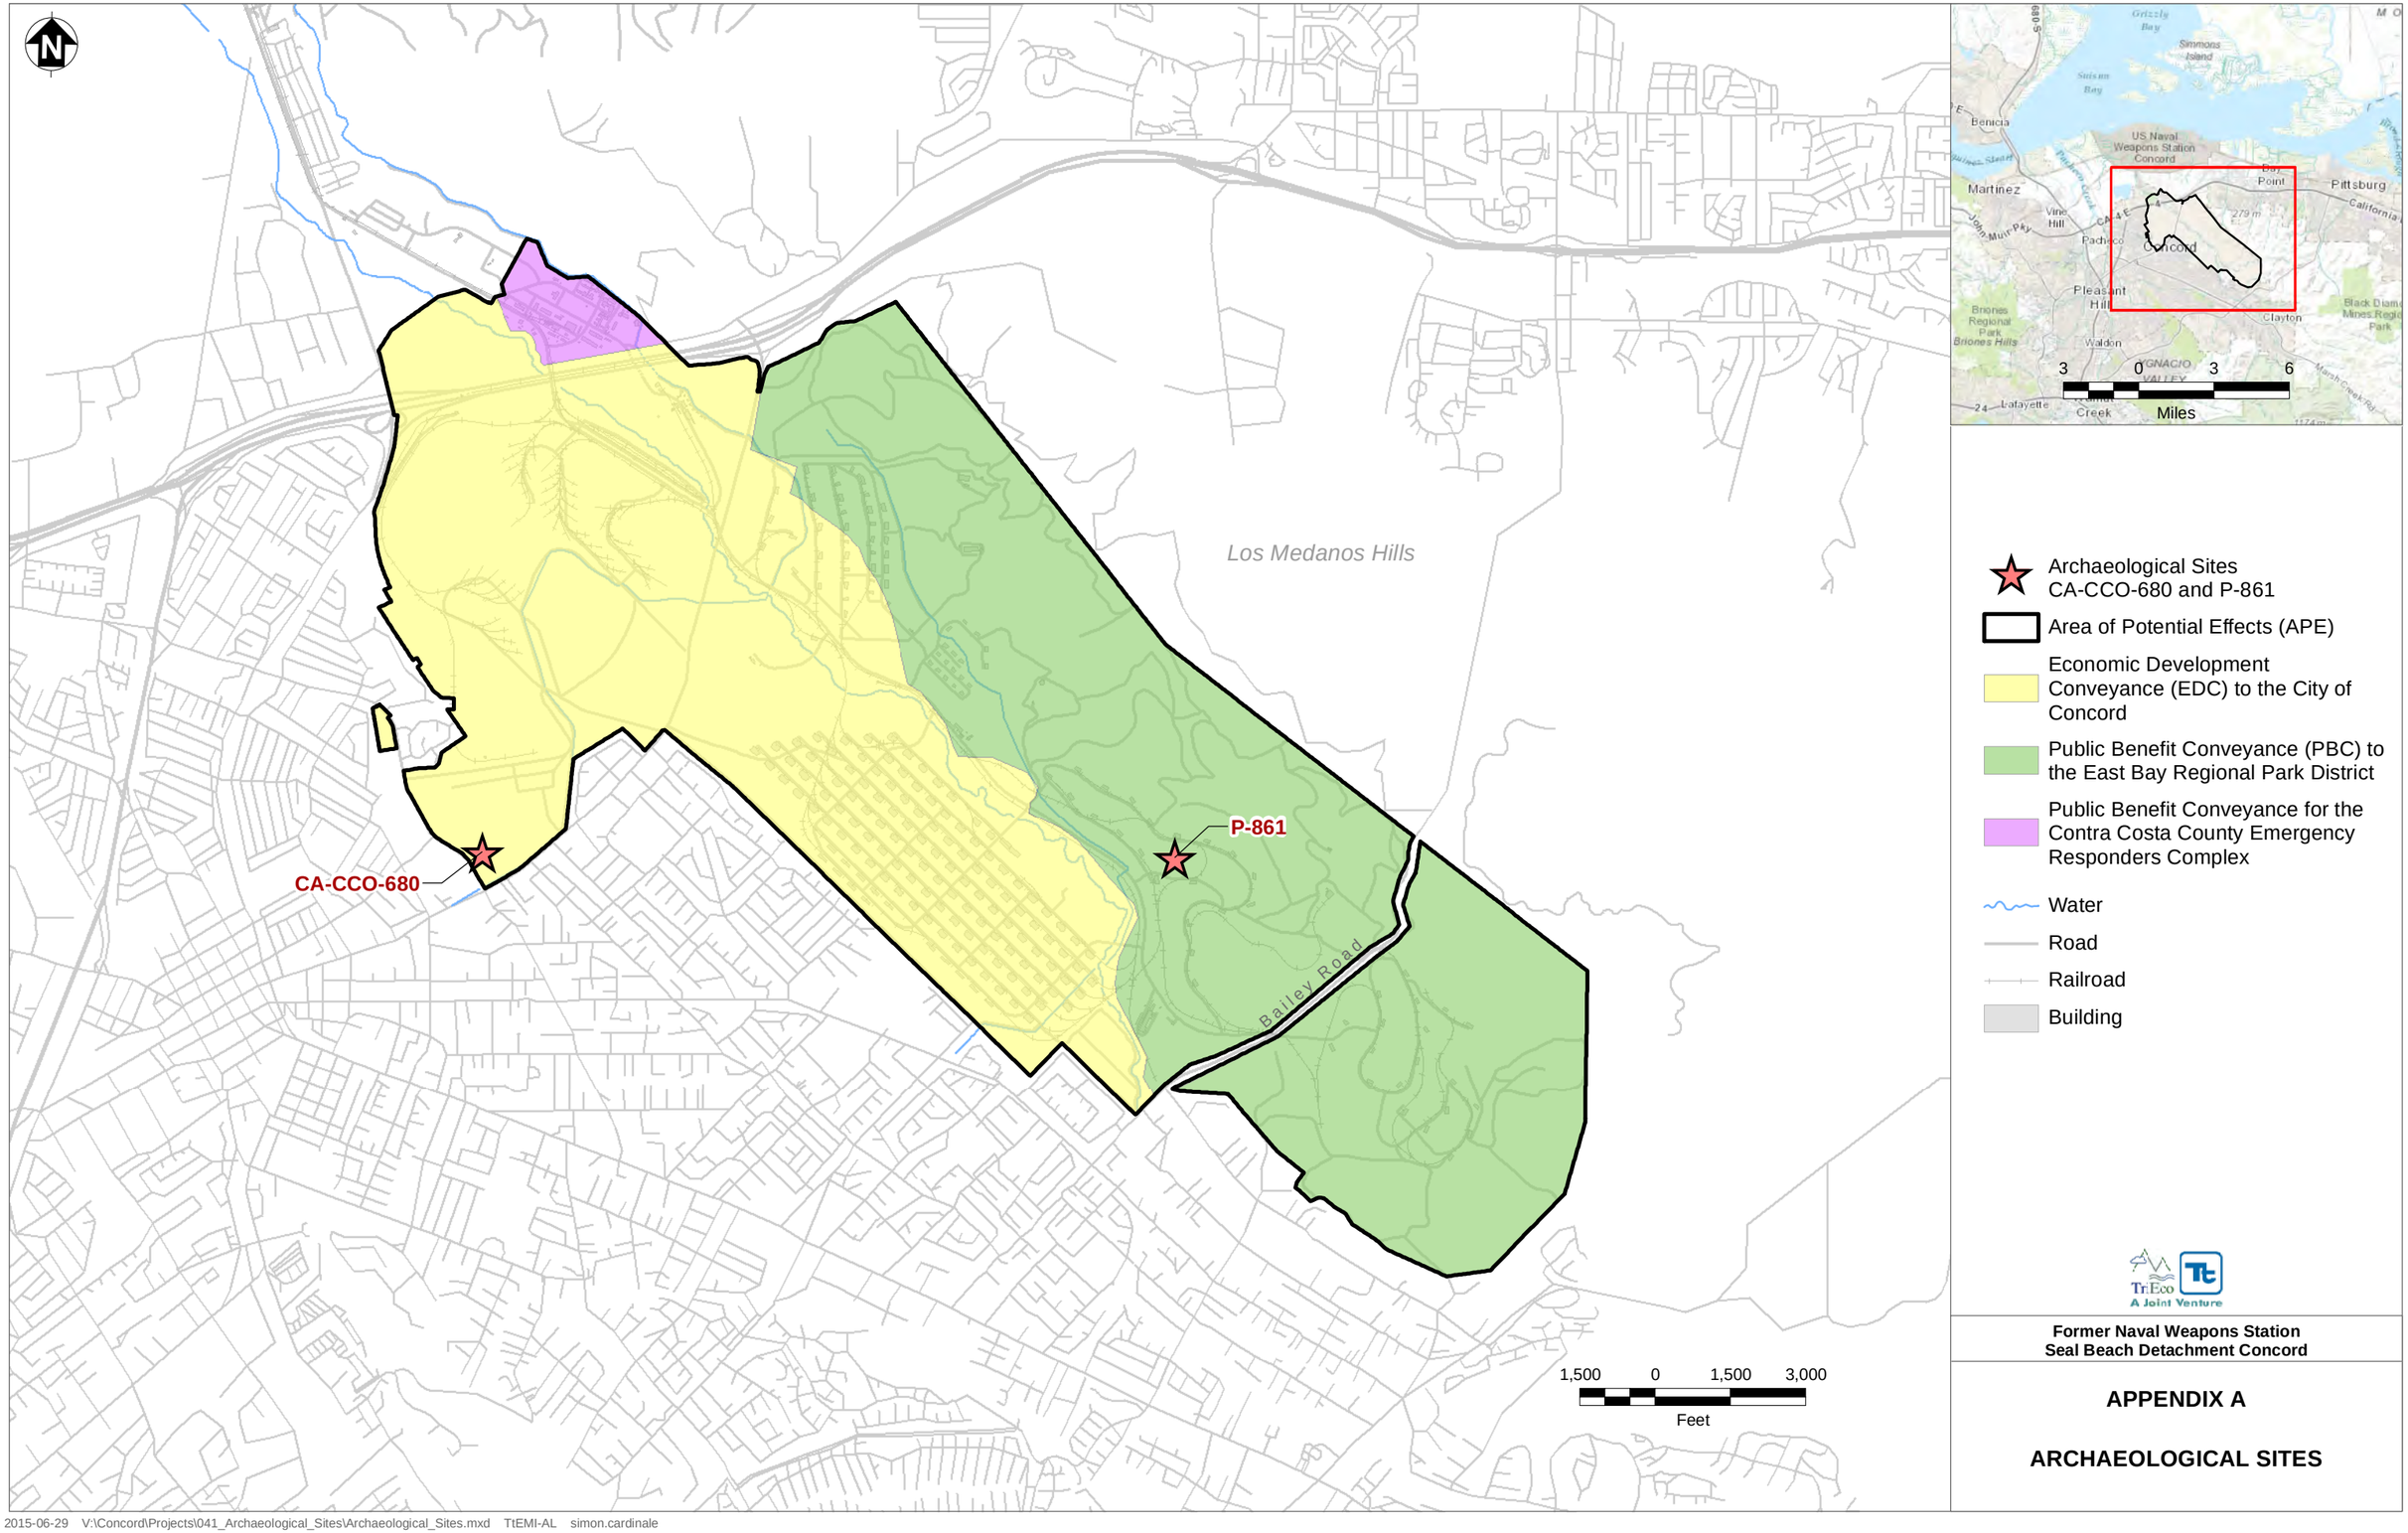
SECTION 106 MEMORANDUM OF AGREEMENT (MOA) BETWEEN THE UNITED STATES NAVY, UNITED STATES ARMY CORPS OF ENGINEERS, AND THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER REGARDING THE DISPOSAL AND REUSE OF THE FORMER NAVAL WEAPONS STATION (NWS) CONCORD, CONCORD, CALIFORNIA

WHEREAS, the U.S. Department of Navy (Navy) has closed and is directed under the Defense Base Realignment and Closure Act (DBCRA) of 1990, Pub. L. No. 101-510, as amended in 2005, to dispose of the former Naval Weapons Station, Concord in Concord, California; and

WHEREAS, the Navy has previously executed Federal-to-Federal property transfers and approximately 5,038 acres of the Inland Area remain available for transfer out of Federal ownership; and

WHEREAS, the Navy is authorized to allow for interim use of property under its pre-conveyance licensing and leasing program; and

WHEREAS, the Navy's transfer of approximately 5,038 acres out of Federal ownership and the Navy's pre-conveyance licensing and leasing program constitute the Navy's Section 106 Undertaking and the 5,038-acre area constitutes the Area of Potential Effects (APE); and



WHEREAS, the Navy consulted on a basewide Historic Evaluation Report which identified no historic properties eligible for the National Register of Historic Places (NRHP), and received California State Historic Preservation Officer (SHPO) concurrence on February 14, 2013; and

WHEREAS, the Navy completed a Phase I archaeological survey of the Inland Area in 2008; and

WHEREAS, the Navy consulted with Federally-Recognized Tribes on a Native American Graves Protection and Repatriation Act (NAGPRA) Plan of Action (PoA) to support the Phase II archaeological evaluation of the Inland Area; and

WHEREAS, the Navy executed a NAGPRA PoA, Amended- August 2012, with the California Valley Miwok Tribe, the Ione Band of Miwok Indians, and the Shingle Springs Band of Miwok Indians, and the Navy reburied all human remains and NAGPRA cultural items on site at archaeological site CA-CCO-680; and

WHEREAS, the Navy identified prehistoric archaeological sites CA-CCO-680 and P-861as the only NRHP-eligible resources, and that there are no identified rural historic

Subject: File Number 2010-00190S

Department of the Navy BRAC PMO West
Attn: Ronald Bochenek
1455 Frazee Road, Suite 900
San Diego, CA 92108

Dear Mr. Bochenek:

Pursuant to the Council on Environmental Quality National Environmental Policy Act (NEPA) regulations (40 CFR 1501.6), and Section 106 of the National Historic Preservation Act (NHPA) (16 USC 470.f), the U.S. Army Corps of Engineers (Corps) requests cooperating agency status on the Concord Naval Weapons Station Closure and Redevelopment Project (CNWS), in the City of Concord, Contra Costa County, California. Your agency is currently acting as lead federal agency for the project, and due to the fact that the Corps will likely be taking over as the federal lead once the closure is complete, it would be beneficial to share resources during the base closure process. Please respond in order to confirm cooperating agency status, or to discuss any questions or concerns.

You may refer any questions on this matter to Ian Liffmann of my Regulatory staff by telephone at (415) 503-6769 or by e-mail at ian.liffmann@usace.army.mil. All correspondence should be addressed to the Regulatory Division, South Branch, referencing the file number at the head of this letter.

Sincerely,

Jane M. Hicks
Chief, Regulatory Division

SUBJECT: NEPA AND SECTION 106 STATEMENT OF COOPERATION

Dear Ms. Hicks:

In response to your letter of March 5, 2013, the Navy concurs with your request to be a Cooperating Agency for the preparation of the Environmental Impact Statement (EIS) for the disposal and reuse of Naval Weapons Station Seal Beach, Detachment Concord (NWS Concord), Concord, CA. The Navy will serve as the Lead Agency and the United States Army Corps of Engineers (USACE) will be designated a Cooperating Agency, as the terms are defined and used in 40 CFR 1501-1508. It is understood that USACE will incorporate the EIS into a future USACE National Environmental Policy Act (NEPA) analysis to support a Clean Water Act Section 404 permit. Additionally, this letter formally accepts the USACE as a consulting party in the Navy's ongoing Section 106 consultation regarding the disposal of the former NWS Concord.

The Navy, as part of its EIS, will study the potential environmental consequences resulting from the disposal of surplus property at NWS Concord from federal ownership and its subsequent reuse in a manner consistent with the *Concord Reuse Project Area Plan*, as adopted by the City of Concord on January 24, 2012. To assess the potential environmental consequences, the EIS will evaluate two property reuse alternatives and a No Action Alternative. Alternative 1 is the reuse of the property in a manner consistent with the *Concord Reuse Project Area Plan*. Alternative 2 consists of a greater amount of residential and mixed-use development. Alternative 2 includes elements of the Connected Villages Alternative (Alternative 2) assessed in the 2008 Draft Environmental Impact Report (DEIR) of the City of Concord's Reuse Plan conducted in compliance with the California

Environmental Quality Act (CEQA). Alternative 2 is included for the purposes of the NEPA analysis and does not imply a change to the City of Concord's adopted Area Plan and 2030 General Plan, which is the result of a public planning process. The No-Action Alternative is evaluated in detail in this EIS as prescribed by CEQ regulations. Both reuse alternatives assume full build-out over a 25-year period; the period of analysis will be during construction and when full build-out has been completed.

The EIS will address potential direct, indirect, short-term, long-term, and cumulative impacts on the human and natural environments, including but not limited to potential impacts on topography, geology and soils; water resources; biological resources; air quality; greenhouse gases and climate change; noise; infrastructure and utilities; transportation, traffic, and circulation; cultural resources; land use; socioeconomics and environmental justice; hazards and hazardous substances; and public services. The level of analysis will consist of a programmatic analysis and will not assess the future proposed reuse in detail (e.g., construction/design-level detail). It is our understanding the USACE has not requested any changes to the "scope" of the EIS analysis, including the proposed action, purpose and need, project area, NEPA alternatives, analysis methodology, project schedule, or proposed public involvement activities as proposed by the Navy. The EIS will be prepared in accordance with all applicable federal guidance, including Section 102(2) (c) of the National Environmental Policy Act (NEPA) of 1969, as implemented by the Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508) and Office of the Chief of Naval Operations Instruction (OPNAVINST) 5090.1C CH-1.

The Navy requests USACE support in preparing the water resources analysis of the EIS, including description of existing conditions and analysis of potential indirect, direct, and cumulative impacts, and participation at the Draft EIS Public Hearing Meeting.

The Navy will cooperate, as necessary, and keep USACE apprised of the status of the NEPA project, including schedule and major project milestones. In addition, the Navy will provide

an opportunity for USACE to review and comment on draft project deliverables, including participation in any Draft EIS and Final EIS government review meetings. It is expected that USACE will review and comment on project deliverables in a timely manner (i.e., within three weeks). The Navy requests that USACE not release preliminary or draft versions of any project deliverable (e.g., Draft EIS) to the public or any other local, state, or federal agency without coordinating and receiving approval from the Navy. The Navy requests that throughout this process, USACE provide timely expert input, analyses review and comment to address the potential impacts of disposal and reuse, and ensure that the EIS schedule is maintained. In addition, the Navy requests that USACE keep the Navy apprised of current events in relation to their proposed Section 404 permitting process.

The Navy is solely responsible for directing the scope of the NEPA analysis and determining the final content of all project deliverables, including the Draft and Final EIS, Notice of Availability, and all public meeting materials; distributing project documents; determining analysis methodology, findings, and conclusions; timing and schedule of the NEPA analysis and project milestones; and responding to all public and agency comments (e.g., response to comments) and public inquiries. All public or regulatory requests for EIS related documents and comments/questions on the Navy's NEPA process or the EIS must be forwarded to the Navy.

The Navy will ensure that input from USACE is appropriately incorporated into the Draft and Final EIS and will utilize USACE's comments to the maximum extent possible, consistent with the legal requirements and our responsibilities as Lead Agency.

The Navy will administer the contracts for the EIS. If the USACE believes an additional contract or funding is required, the USACE will notify the Navy. The Navy will only be responsible for funding and or administering the contract if it is determined by the Navy to be necessary and integral to satisfy the Navy's NEPA obligations. Both agencies will work cooperatively and in good faith. The Navy retains all decision-making authority over the EIS.

5090
Ser BPMOW.rjb/0188

APR 1 2013

In addition to the request for NEPA Cooperating Agency status, your March 5, 2013 letter also requested collaboration between our agencies regarding Section 106 of the NHPA. Recognizing the opportunity for Navy/USACE collaboration in our agencies' compliance with Section 106, the Navy accepts the USACE as a consulting party in the Navy's ongoing Section 106 consultation concerning the proposed disposal of the former NWS Concord. The Navy initiated consultation on this undertaking in 2007 and has recently re-engaged consultation to move forward with the identification of historic properties within the Area of Potential Effects. At a minimum, USACE support will be necessary for future consultation meetings and for the analysis and resolution of potential effects on historic properties related to wetland habitat restoration / mitigation, or other aspects of the USACE's 404 permitting process. The Navy looks forward to the USACE's participation as a consulting party, as defined under Section 106 of the National Historic Preservation Act and its implementing regulations at 36 CFR 800. We request that our agencies' cultural resources managers and regulatory staffs confer in order to discuss the details of this approach.

As the consultation progresses and additional information about historic properties and potential effects becomes available, the Navy and USACE will need to continue coordination regarding the most appropriate Section 106 compliance strategy(ies) for our two agencies. Accordingly, our agencies may revisit the USACE's role and responsibilities under Section 106. For example, should it be necessary to resolve adverse effects related to the USACE's 404 permitting process, the USACE's role under Section 106 may expand to include signatory or invited signatory status on a Section 106 agreement document such as a Memorandum of Agreement or Programmatic Agreement. Alternatively, the USACE may choose to conduct a separate Section 106 consultation that tiers off from the Navy's consultation.

If you have any questions regarding the Navy's NEPA process or the NWS Concord EIS, please contact Mr. Ronald Bochenek, NEPA Planner, at (619) 532-0906 or ronald.bochenek.ctr@navy.mil. Should you have any questions regarding the Navy's Section 106

33000 Nixie Way, Building 50
San Diego, California 92147

Mr. Guy Bjerke, Director
City of Concord
1950 Parkside Drive
Concord, California 94519

Dear Ms. Spinelli and Mr. Bjerke:

This letter is in reference to the meeting on November 23, 2015, concerning the Concord Reuse Project. The U.S. Navy is proposing the disposal and subsequent redevelopment of 5,028 acres of surplus property at the former Concord Naval Weapons Station (CNWS). Land transfers are proposed to the City of Concord and the East Bay Regional Parks District. The City of Concord will oversee the proposed redevelopment of approximately 2,500 acres of the former CNWS. It was initially estimated that redevelopment would impact approximately 16 acres of wetlands and other waters subject the U.S. Army Corps of Engineers jurisdiction, but estimates have more recently been revised to approximately 6.27 acres of impacts. The purpose of the meeting was to discuss the Corps' approach for complying with Section 106 of the National Historic Preservation Act, the 404(b)(1) Guidelines, and the National Environmental Policy Act. This letter documents our agreement for working with the Navy and City in regard to the aforementioned laws and regulations.

As set forth in 33 CFR 335, Appendix C(2)(c) and 36 CFR 800.2(a)(2), Section 106 compliance should not be duplicated by federal agencies. The U.S. Army Corps of Engineers (Corps) recognizes the broader scope of the Navy's undertaking will cover the magnitude and extent of the Corps' undertaking which is more narrowly defined as the discharge of dredged or fill material into waters of the United States (WOTUS). Section 106 compliance work undertaken by the Navy will be accepted by the Corps. As such the Corps does not need to be a party to the Memorandum of Agreement (MOA) but will incorporate the terms of the MOA into special conditions of any permit issued.

The Corps supports the City's approach for acting as applicant for the Concord Reuse Project as opposed to evaluating numerous permit applications from individual developers. In evaluation of permit applications to discharge dredged or fill material into WOTUS, the Corps must evaluate alternatives that accomplish the purpose and need of the project and that are reasonable and practicable. This review is

conducted pursuant to the National Environmental Policy Act (NEPA) and the 404(b)(1) Guidelines Evaluation (Guidelines). As discussed during the meeting, reasonable alternatives evaluated by the Navy in the Environmental Impact Statement (EIS) document may or may not suffice as practicable alternatives under the Guidelines. This determination will be made following our review of the 404(b)(1) analysis submitted by the City.

With regard to NEPA compliance, the Corps' preliminary determination based on the current project impacts is an Environmental Assessment and Finding of No Significant Impact (EA/FONSI) will be prepared to inform the permit decision. The EA/FONSI will incorporate by reference applicable sections of the EIS to avoid redundancy where possible. Upon receipt of a final project description including quantification of impacts to WOTUS and required drawings (site plan, impacts, etc.) the Corps will circulate a public notice for the project. Submittal of the 404(b)(1) is not required for the public notice but a statement on how the project has been designed to avoid, minimize, and mitigate for impacts to WOTUS is required.

If you have questions regarding this letter or the project please don't hesitate to contact me at by telephone at 415-503-6768 or by email at tori.white@usace.army.mil.

Sincerely,

Appendix B Scoping Summary Report

This page intentionally left blank.

Final Scoping Process Summary

for the

Environmental Impact Statement for the Disposal and Reuse of Surplus Property at Naval Weapons Station Concord Concord, California

June 2014

NAVFAC
Naval Facilities Engineering Command
BRAC Program Management Office

Prepared by:

Ecology and Environment, Inc.
368 Pleasant View Drive
Lancaster, NY 14086

1 Overview

In accordance with the National Environmental Policy Act (NEPA) and regulations set forth by the Council on Environmental Quality (CEQ), the U.S. Department of the Navy (Navy) implemented a scoping process to encourage and facilitate public involvement early in the development of the environmental impact statement (EIS) for the disposal and reuse of surplus property at the former Naval Weapons Station (NWS) Concord, California. Individuals and public agencies were encouraged to review information about the proposed action and express their concerns and issues to be addressed in the EIS by submitting comments to the Navy. The purpose of this document is to provide the results of the scoping process, a summary of the comments received, and a brief description of how the comments will be addressed in the Draft EIS.

As stated in the CEQ regulations implementing NEPA, the scoping process is designed to:

- Identify people or organizations who are interested in the proposed action
- Identify the scope (e.g., range of actions, alternatives, and impacts) and the significant issues to be analyzed in the EIS
- Identify and eliminate from detailed review those issues that will not be significant or those that have been adequately covered in prior environmental review
- Identify gaps in data and informational needs
- Set time limits for the process and page limits for the EIS
- Identify any related environmental assessments (EAs) or EISs
- Identify other environmental review and consultation requirements so they can be integrated with the EIS
- Indicate the relationship between the development of the environmental analysis and the agency's tentative decision-making schedule.

The public scoping period was initiated with publication of the Notice of Intent (NOI) in the *Federal Register* on March 14, 2013. The scoping period concluded on April 19, 2013. Two open house sessions were held on a single day (April 4, 2013) to present information to the public on the Navy's proposed action, alternatives, and resource areas to be addressed in the EIS. Comments from the public could be submitted in writing to Navy representatives during the open house sessions; or mailed in, emailed, or faxed to the Navy's designated point of contact. Comment sheets were provided at the open house sessions for members of the public to use in documenting their written comments during the public meetings.

1.1 Public Notification

1.1.1 Notice of Intent

An NOI to prepare the EIS was published in the *Federal Register* on March 14, 2013 (78 *Federal Register* [FR] 16255; see Appendix A). The NOI described the proposed action and alternatives and provided information on the Navy's scoping process, including the date, location, and times of two public scoping open house sessions to be held in the vicinity of the former NWS Concord.

1.1.2 Newspaper Display Notices

A newspaper display notice announcing the Navy's public scoping process, including the date, location and times of the public scoping open house sessions, was published in local daily newspapers that serve the population in the vicinity of the former NWS Concord. The notice was published in the following newspapers on the following dates:

- ***Contra Costa Times*: March 17, 29, 30, and 31**
- **East County Times: March 17, 29, 30, and 31**
- **A copy of the display notice is provided in Appendix A.**

1.1.3 Scoping Notification Mailer and Email

A mailer announcing the Navy's intent to prepare an EIS and to announce the public scoping process was distributed on March 14, 2013, to 2,600 federal, state, and local agencies, elected representatives, tribal entities, neighborhood alliances, and other stakeholders including residents and businesses within 500 feet of NWS Concord. An email address was available for approximately 1,184 residents and businesses within 500 feet of NWS Concord in lieu of the postal address, and for these stakeholders, an email notification was provided. A copy of the scoping notification mailer is provided in Appendix A.

1.1.4 California State Clearinghouse Notification

A Notice of Completion and Environmental Document Transmittal form was completed and delivered to the California State Clearinghouse on March 15, 2013.

1.1.5 Websites

The Base Realignment and Closure Program Management Office (BRAC PMO) provided the NOI to the Chief of Information (CHINFO) for posting to the BRAC PMO website (www.bracpmo.navy.mil). Additionally, the BRAC PMO provided the NOI to the City of Concord for posting on the city's website, as appropriate.

2 Public Scoping Meetings

2.1 Meeting Locations and Attendance

Two public scoping open house meeting sessions were held on April 4, 2012 from 4:00 p.m. to 6:00 pm and 7:00 p.m. to 9:00 pm. The open house was held at the Concord Senior Citizen's Center (Wisteria Room), 2727 Parkside Circle, Concord, California, 94519. Fifty-nine people attended the sessions.

2.2 Meeting Format and Information Provided to the Public

The Navy used an "open house" meeting format for the scoping meeting sessions. This format provides interested persons with an opportunity to review information presented at the meeting and ask questions of project representatives in an open, one-on-one setting before formulating their comments. The open house format provided a variety of layered information sources to meet individual needs and allowed for maximum community participation.

The open house layout also provides attendees with a continuous and logical flow of information about the project and offers various methods for commenting. On entering the open house, attendees were directed to a sign-in table. EIS team members at the sign-in table explained the layout of the open house and how to provide comments.

The open house included eight display booths. The booths exhibited posters with the following titles:

- The BRAC Process
- NEPA and the EIS
- Proposed Action and Alternatives
- Key EIS Topic: Land Use and Socioeconomics
- Key EIS Topic: Natural Resources
- Key EIS Topic: Quality of Life
- Key EIS Topic: Traffic and Transportation
- Key EIS Topic: Cultural Resources

The EIS team members staffed the display booths and answered questions, provided handouts, and assisted participants in submitting their comments.

Handouts available at the sign-in table and at display booths were designed to complement the display booths and to provide further information for attendees. Handouts included:

- *Base Realignment and Closure (BRAC) Process*
- *The National Environmental Policy Act (NEPA) and the EIS Process*
- *Proposed Action and Alternatives*
- *Key Topics – Environmental Impact Statement Naval Weapons Station Concord*
- *Cultural Resources*
- *Agency Contact Information*

Additionally, a poster on how to comment was also provided at the meeting, and comment forms and comment boxes were available on tables throughout the meeting room.

3 Summary of Comments and How Issues Will Be Addressed

3.1 Introduction

Scoping "statements" and scoping "comments" are defined in this report as follows:

- **Scoping Statement.** A letter, website entry, or comment submitted by comment form during the formal scoping period that may include one or more comments.
- **Scoping Comment.** One or more single issues contained in the scoping statement, related to the scope of the EIS (e.g., the purpose and need for the project, alternatives, or potential environmental impacts).

Comments about the project were written and submitted on comment forms at the scoping meetings. Other comments were received by regular mail, email, or fax. A total of 40 scoping statements were submitted during the formal scoping period. These 40 scoping statements comprised 101 comments. Fifteen comment forms were submitted at the public scoping open house sessions; the remaining comments were submitted after the meeting. Many of the scoping statements and comments focused on the development scenarios and mitigation measures that would occur after property transfer and on pre-construction.

Table 3-1 provides a summary of the scoping statements received.

Table 3-1 Format of Scoping Statements Received

Type of Scoping Statement	Number of Scoping Statements
Comment form at scoping meeting	15
Mail-in/fax/email letter from government agencies (local, state, federal)	9
Email letter from the public (including community-based organizations, neighborhood alliances, and residents)	8
Mail-in or fax letter from public	8
Total	**40**

3.2 Scoping Statements from Government Agencies and Elected Representatives

Comments received from federal, state, and local government agencies have been incorporated into the summary tables of issues and concerns by resource area (see Table 3-3). Agency comments are also summarized below by agency.

3.2.1 Elected Representatives

No scoping statements were received from federal or state elected representatives. One comment was received from the Mayor of Concord at the open house scoping meeting. The mayor indicated his support for an efficient and expedited NEPA process.

3.2.2 Federal Agencies

Comments were received from the U.S. Coast Guard (USCG) and the U.S. Environmental Protection Agency (EPA), Region 9.

The USCG noted a preliminary determination that the adjacent former U.S. Navy housing area, with 78 housing units, is in excess of its needs and that a decision has not been reached on potential disposal methods.

The EPA commented on a range of issues, including the following:

- Remediation requirements for the associated site parcels
- Construction and operational impacts on air quality
- Inclusion of alternatives to demonstrate compliance with Clean Water Section 404(b)(1) Guidelines
- Compliance with Section 438 of the Energy Independence and Security Act, i.e., measures to mitigate flow increases above pre-development levels, including the use of green infrastructure or low-impact development (LID) practices
- Indirect effects such as the potential for population and employment growth off-base
- Climate change effects and adaptation measures, including the use of on-site renewable energy components.

3.2.3 State Agencies

Comments were received from the California Public Utilities Commission and the California Department of Transportation (Caltrans).

The Public Utilities Commission commented on a range of issues, including the following:

- Development should be planned with consideration of the safety of the adjacent railroad/light rail right-of-way (ROW)
- Pedestrian circulation patterns or destinations with respect to the railroad ROW and compliance with the American Disabilities Act
- Increased traffic volumes at at-grade rail crossings
- Mitigation measures such as planning for grade separations at major thoroughfares, improvements at existing at-grade crossings, and installing continuous vandal-resistant fencing/barriers to limit trespasser access onto the railroad ROW.

Caltrans commented that the DEIS should address the following issues:

- Traffic impacts such as project-related trip generation, distribution, and assignment
- Calculation of average daily traffic, morning and evening peak hour volumes and levels of services, and cumulative traffic volumes
- Consistency with local plans
- Mitigation measures for roadways or intersections with insufficient capacity to maintain acceptable levels of service (LOSs)
- Traffic impact fees
- Scheduling and costs associated with planned improvements
- Cumulative impacts on state ROWs such as hazardous materials transport, tree removal, seasonal wetlands, and water quality impacts
- Bicycle and pedestrian facilities and local BART stations.

Additionally, Caltrans indicated that the Navy needs to coordinate projects with Caltrans, CCTA, and the city and that the developer must submit a transportation management plan prior to construction. The Caltrans letter also identifies the permits that must be obtained by the developer prior to construction and the studies/documentation that must be submitted with these permit applications.

3.2.4 Local Agencies

Comments were received from the City of Concord, the City of Antioch, the Contra Costa Environmental Health Division, and the East Bay Municipal Utility District (EBMUD).

The City of Concord reiterated its support for Alternative 1 (the Preferred Alterative), encouraged the Navy to incorporate the findings of the city's Final Environmental Impact Report (EIR) into the Navy's DEIS to the maximum extent possible; and recommended the use of graphics and boundaries used by the City of Concord in its EIR.

The City of Antioch was primarily concerned with traffic and transportation impacts and resubmitted a 2009 letter that provided comments on the City of Concord's EIR.

The Contra Costa Environmental Health Division (CCEHD) commented on pre-construction issues, identifying permit requirements, recommending that future projects are served by public sewer and city water, and noting that closed landfills on the property may fall under their jurisdiction following property disposal.

The EBMUD indicated that project development could 1) increase encroachment onto the Aqueducts right-of-way (R/W), 2) generate storm water and flooding impacts; and 3) generate flow impacts in Mt. Diablo Creek. EBMUD requested that the developer submit proposals for review and referenced additional pre-construction requirements.

3.2.5 Tribal Governments

No scoping comments were received from Native American tribal representatives.

3.3 Summary of Issues of Concern by Resource Area

All of the comments received from the public and from state, local, or federal agencies were identified and tabulated in a database by topic. Comments from the public were mostly from private citizens. Table 3-2 categorizes the comments received by frequency and topic. Issues related to the proposed action and alternatives received the most comments, followed by traffic and transportation and land use, open space and community facility/services. A number of comments indicated various permit requirements or recommendations for agency consultation prior to construction. Table 3-3 provides a summary of the comments received, organized by resource area.

Table 3-2 Frequency of Comments by Topic

Topic	Number of Comments
Proposed Action and Alternatives	22
Traffic and Transportation	13
Land Use, Open Space, and Community Services	11
Natural Resources	9
Socioeconomics	7
Quality of Life	6
Air Quality	5
Water Resources/Quality	3

Table 3-2 Frequency of Comments by Topic

Topic	Number of Comments
Cultural Resources	3
Environmental Management	3
Infrastructure/Energy	2
Noise	1
Required Consultations or Permit Requirements	8
Miscellaneous Comments	8
Total	**101**

3.3.1 Proposed Action and Alternatives

Twenty-two comments were received regarding the proposed action and alternatives. The majority of these comments (15) indicated a preference for Alternative 1. Many of the commenters noted that the city's reuse planning process resulted in the Area Plan (Alternative 1) and questioned why a second alternative discarded during the city's reuse planning process was included as Alternative 2. Five comments indicated a preference for the No Action alternative. One comment from the City of Concord expressed the importance of keeping map and alternative boundaries consistent between the Navy's NEPA EIS and the city's California Environmental Quality Act (CEQA) EIR. One commenter suggested a design change to the proposed action, noting that the existing railroad ROW could be removed and replaced by a through-street.

The EIS will evaluate the impacts of Alternative 1 (the Preferred Alternative, which is consistent with the Concord Reuse Area Plan). NEPA also requires the assessment of a second alternative (Alternative 2) and a No Action alternative. The Navy will not change elements of the Concord Reuse Area Plan in response to public comments; however, more specific development scenarios within the context of the Area Plan may need to be assumed in order to assess the potential impacts.

3.3.2 Transportation

Transportation concerns were noted in 13 comments. Most of the comments were submitted by neighborhood residents who expressed concern that the influx of residents and vehicles would generate more traffic in an already congested area and within the region. Specifically, residents were concerned with traffic on Concord Boulevard at the intersections of Bailey Road, Denkinger Road, and West Street, and on Bailey Road; and they noted that traffic is an issue in the vicinity of the four area schools. One commenter noted that the addition of connector streets and the increased traffic on local streets would adversely impact their neighborhood (Dana Estates). One commenter resides in the neighborhood adjacent to the North Concord BART station, where commuter traffic is a concern, and requested that the DEIS study traffic impacts and recommend reasonable solutions/mitigation. Several commenters suggested the need for a traffic study during the EIS process. Caltrans also submitted several comments in a single comment statement, suggesting that the Navy employ specific methodologies and guidance in development of the DEIS. Caltrans also commented on traffic impact fees, mitigation, and funding sources. The City of Antioch indicated its concerns regarding impacts of the reuse plan on the regional transportation network and requested that the DEIS consider the impacts and concerns contained in the Transplan Committee letter submitted to the City of Concord in 2009.

The California State Public Utilities Commission indicated that the project area includes active railroad and/or light rail tracks. The agency recommended that future development in these areas be planned with the safety of the rail corridor in mind, especially at at-grade crossings. The agency recommended that the DEIS consider pedestrian circulation patterns or destinations and compliance with the Americans with

Disabilities Act. Additionally, the comment identified mitigation measures that could be employed to address these issues.

The EIS will evaluate effects of the proposed action on transportation, traffic, pedestrians, and alternative transportation users within and around the surplus property. The EIS will include an examination of existing and future transportation conditions, including existing and future traffic volumes and levels of service, trip generation, trip distribution, and accident analyses. The EIS will also recommend potential measures to mitigate traffic impacts.

3.3.3 Land Use, Open Space, and Community Facilities/Services

Concerns related to land use, open space, and community facilities/services were noted in 11 comments. Most of the comments indicated the commenters' preference to preserve open space and natural resources both to protect wildlife and habitat and to provide users with parks and opportunities for passive recreational activities such as hiking, bicycling on trails, horseback riding, and other activities. One commenter requested that motorized sports (e.g. Motocross) be banned.

One comment indicated that a local residential developer owns land adjacent to the boundary of the former NWS Concord, including the ridge top, and that the DEIS should consider that these lands will be developed in the near future. With respect to community facilities/services, one comment requested that bus routes be provided at 15-minute intervals for access to/from the base area and Willow Pass Road. One agency recommended that future projects be served by public sewer and city water. A commenter requested that the proposed development scenarios include large percentages of single-family homes in order to be compatible with surrounding neighborhoods.

The EIS will address the property-specific plans included in the city's Area Plan, but implementation of the Reuse Plan and management of the redevelopment and construction is the responsibility of the City of Concord as the Local Redevelopment Authority (LRA). The EIS will address existing land uses and will include an evaluation of direct, indirect, and cumulative impacts on surrounding land use. The EIS also will address existing community facilities and infrastructure and the impacts of each alternative on these facilities.

3.3.4 Natural Resources

Nine comments pertained to natural resources. A community-based organization (CBO) has designated the area as one of the 15 priority plant protection areas of the East Bay, noting that the project area includes aspects of a native landscape that are worth conserving and restoring.

A state agency (Caltrans) commented that project-level activities related to habitat restoration and management should be coordinated with local and regional habitat conservation plans and with Caltrans where their programs share stewardship responsibilities for habitats, species, and/or migration routes.

Many commenters were concerned with protecting habitat from development and human impacts. These resources include the riparian corridor and 100-year floodplain setback; local wildlife; and wetlands. One commenter wants to see wetlands restored or created to attract wildlife. The same commenter requested that all development be required to use only native plants, grasses, and trees. One commenter generally noted that the EIS should evaluate the impacts of resource preservation or removal.

Several comments were concerned with local wildlife such as elk, deer, cows, coyote, turkeys, and birds as well as threatened and endangered species such as tiger salamanders, red-legged frogs, and burrowing owls.

The EIS will use recent data and will coordinate with federal and state resource agencies to address potential impacts on natural resources, soils, and water resources. The Navy will not be responsible for development of the site or for associated mitigation measures but will identify recommended mitigation measures in the DEIS.

3.3.5 Socioeconomics

Seven comments were received regarding socioeconomics. Three commenters were concerned that their property values would decrease as a result of the adjacent development and associated traffic, air quality, and noise impacts. Four commenters requested that the DEIS evaluate the number and types of jobs and economic opportunities associated with the project. The EPA indicated that the DEIS should identify indirect effects that could occur outside the project boundary, including the potential increase in off-base population and employment. One commenter added that the DEIS should study housing affordability and should identify the sources of funding for new transit service.

The EIS will study the direct, indirect, and induced socioeconomic impacts of the project alternatives. These impacts include both construction and operations employment and spending. The EIS will provide reasonable assumptions associated with the alternatives, in terms of size, number of employees, trip generation, etc. for each of the planned uses in order to present a quantitative impact assessment. Housing affordability and property values will be discussed in general terms.

The City of Concord, as the LRA, will be responsible for identifying funding sources associated with future development; the site developers will determine specific employment needs and skillsets.

3.3.6 Quality of Life

Quality of life issues were the subject of six comments. The commenters were neighborhood residents and homeowners who indicated that they moved to the area for serenity and open space, and the combined effects of additional traffic, noise, and air pollution would decrease their quality of life. One commenter noted that the city's traffic study near Denkinger Road and West Street indicated that noise pollution is beyond acceptable and questioned what could be done to minimize/mitigate air and noise pollution in the area of Concord Boulevard, Denkinger Road, and West Street.

The quality of life issues of noise, air quality, and traffic will be addressed as separate resource areas in the DEIS. The cumulative impacts on these resource areas will be evaluated, and a general assessment will be made regarding quality of life impacts.

3.3.7 Air Quality

Air quality was the subject of five comments. The EPA recommended that the DEIS provide a detailed discussion of ambient air conditions, National Ambient Air Quality Standards (NAAQS), criteria pollutant nonattainment areas, and potential air quality impacts. The EPA also recommended that the EIS provide adequate discussion on construction and operational emissions as well as mitigation measures that have been adopted in the city's reuse plan and the party responsible for implementation. Additionally, the EPA requested that the DEIS discuss the additive impacts from climate change on resources affected by the project; climate change adaptation measures; and the energy requirements and conservation potential of various alternatives and mitigation measures. The discussion should address whether any part of the energy demand for development could be met with on-site renewable energy component.

One commenter indicated that residents of Esperanza Drive are currently exposed to wind and pollution from two freeways and expressed concern about the air quality impacts resulting from additional traffic. Another commenter expressed doubt that future development would affect climate change and greenhouse gas (GHG) emissions.

The EIS will describe ambient air conditions, NAAQS, and criteria pollutant nonattainment areas; address air quality impacts; and discuss construction and operational emissions. Additionally, the EIS will discuss the additive impacts of climate change, climate change adaptation measures, and the energy requirements and conservation potential of various alternatives.

3.3.8 Water Resources/ Water Quality

Water resources and water quality were the subject of three comments. The EPA recommended that the DEIS describe all waters of the U.S. that could be affected by the project and indicated that NEPA alternatives should be crafted for consistency with Section 404 permit requirements. The East Bay Municipal Utility District noted that any activities conducted in the vicinity of their facilities could generate storm water and flooding impacts if not adequately mitigated. A resident of Esperanza Drive expressed concern about groundwater contamination resulting from cleanup activities or project construction.

The EIS will address water quality, surface water and groundwater impacts, and will recommend storm water prevention and protection measures. The EIS also will discuss the project alternatives and compliance with the Section 404 process as appropriate.

3.3.9 Cultural Resources

Cultural resources were the topic of three comments. One comment, submitted by Caltrans, indicated that the DEIS must include documentation of a current archaeological record if construction activities are proposed within the state ROW. These construction activities include but are not limited to lane widening, channelization, auxiliary lands, and/or modification of existing features such as slopes, drainage features, curbs, sidewalks, and driveways within or adjacent to the state ROW. Two residents expressed a desire to honor NWS Concord's history; one commenter suggested a display commemorating how NWS Concord served the U.S. during World War II; and the other commenter recommended tours, monuments, and plaques to honor NWS Concord servicemen and servicewomen.

The EIS will present a discussion of the Navy's compliance with the requirements under the National Historic Preservation Act (NHPA) of 1966 and other pertinent statutes. Additionally, the EIS will include the results of cultural resources survey (architecture and archaeology) that are under way. The City of Concord is responsible for implementation of the Reuse Plan and ultimately will decide how to incorporate historical memorabilia into the new development.

3.3.10 Environmental Management

Three comments were received in relation to environmental management. The EPA requested that the DEIS identify hazardous contaminants associated with the site and provide a general overview of the cleanup status. The agency recommended that for each parcel, the DEIS describe land use, the proposed cleanup remedy, and proposed development activities, and that the DEIS discuss how construction activities could come in contact with site contamination. Per the EPA, the DEIS should also provide an overview of monitoring pursuant to Superfund cleanup, including the party responsible for monitoring. A neighborhood alliance also asked that the Navy identify how environmental cleanup will be managed. One resident expressed concern about potential exposure to toxins during site remediation activities, whether through air or soil.

The EIS will describe the CERCLA process as a parallel but separate process that will ensure public health and safety of properties prior to transfer.

3.3.11 Infrastructure/Energy

Two comments were related to infrastructure/energy concerns. The key issue of concern was the implementation of sustainable practices in the redevelopment. The EPA recommended the use of standards and guidelines consistent with "green buildings" and the use of LID options to mitigate potential impacts on water quality. A resident suggested that the development incorporate a recycled water program for irrigation and asked that developers be required to include alternative energy programs in their development plans.

Infrastructure and utility requirements will be discussed in the EIS, including a discussion of Section 438 of the Energy Independence and Security Act (EISA); however, The City of Concord is responsible for the implementation of the Reuse Plan and management of property and redevelopment and will ultimately decide what, how, and where green building techniques or alternative energy elements may be incorporated.

3.3.12 Noise

One comment was submitted in relation to noise impacts. The resident was concerned with increased noise associated with the influx of residents within the project area and requested a noise study at the intersection of Concord Boulevard and Denkinger/West, and on Willow Pass and Landana Roads.

The EIS will document baseline noise conditions at various locations in the vicinity of the project area and will estimate the impacts of construction and operations noise for each alternative.

3.3.13 Required Consultations or Permit Requirements

Three agencies submitted comment statements indicating pre-construction requirements or recommendations. Eight comments were contained in these statements. Examples include Caltrans (the developer may be required to submit a Transportation Management Plan prior to construction and obtain transportation permits for oversize vehicles); East Bay Municipal Utility District (any proposed projects in the aqueduct's ROW must be submitted to EBMUD for review and approval, and may require permits); and the Contra Costa Environmental Health Division (a permit is required for any well or soil boring prior to commencing drilling activities; some closed landfills may come under the jurisdiction of the agency after transfer of the property).

The City of Concord will be responsible for development of the property following property transfer. The city will select project developers, and those developers will be required to consult with the appropriate agencies and comply with the various permit requirements during project design and prior to construction.

3.3.14 Miscellaneous Comments

Eight comments were submitted that do not fall within any of the aforementioned resource areas. Several commenters noted that the city's EIR process was comprehensive and that the Navy's EIS should utilize the previously submitted information and Final EIR findings to the maximum degree possible in order to expedite the NEPA process. One commenter requested that the NEPA process be open and inclusive. Another commenter requested that the DEIS described how weapons will be removed from the site. The USCG submitted notification that the adjacent parcel (78 housing units on the former U.S. Navy housing area in Concord) is in excess of their needs.

The Navy EIS will utilize existing information to the extent practicable during the NEPA process. The NEPA process incorporates public involvement at several points; the public is afforded opportunity to comment during scoping, after the DEIS is completed, and after the FEIS; and agencies are consulted as appropriate during development of the EIS. The EIS will describe the activities to be undertaken during disposal and transfer of the property.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
Proposed Action and Alternatives		
1	Local Agency (City of Concord)	The Navy has made a determination that a more intense land use alternative to the Area Plan is required to be part of the analysis. While the LRA is not in agreement with the necessity of such an analysis, we agree with the use of an alternative developed, and not selected, during the community planning process, as Alternative 1. We will work with the Navy and the community to make sure the purpose for inclusion of the previously eliminated alternative in the EIS is clear.
2	Local Agency (City of Concord)	Staff noticed, in looking at the graphics at Station 2 of the scoping meeting, discrepancies between the approved Concord Reuse Project Area Plan and Alternative 2 and the station exhibit. As a specific example, in the representation of the Area Plan, the green frame around the village neighborhoods was not accurately represented. This is such an important aspect of the plan to the residents that it raised a lot of negative comments from the community. The LRA would recommend that its original graphics be used.
3	Local Agency (City of Concord)	We concur with the Navy's use of the Area Plan as the preferred land use alternative for the transfer action.
4	CBO (California Native Plant Society)	The Concord Reuse Project Area Plan is described as Alternative 1 of the Navy's NOI document. East Bay CNPS was very active in providing input and supporting the plan during its development and therefore recommends Alternative 1 of the NOI be adopted so that the City of Concord can begin implementing it.
5	CBO (California Native Plant Society)	East Bay CNPS recommends that the purpose of the proposed action as described on page 2 of the NOI be modified to also include the conservation of natural resources. Modifying the purpose in this way would ensure that it is consistent with the Concord Reuse Project Area Plan, which set aside the majority of the surplus property at the CNWS for Open Space and Parks and Recreation Use.
6	CBO (California Native Plant Society)	The East Bay CNPS notes that Alternative 2 of the NOI includes less open space and fewer parks than Alternative 1 in favor of greater development intensity. We understand that a range of alternatives are required for consideration as part of an EIS, and we ask that the environmental impacts of this more intensive development plan be addressed as part of the environmental review, especially in the context of impacts on biological resources, including endangered species, geology and soils, and hydrology. We also note that Alternative 2 does not meet the stated purpose of the NOI to be consistent with the Concord Reuse Project Area Plan and that Alternative 1 is therefore the superior Alternative.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
7	CBO (Contra Costa Building Trades Council IBEW Local 302 and the Central Labor Council)	Our members and partners have a vested interest in balancing the density and availability of open space, affordable housing, good jobs, and local benefits for local residents of the base development process. I want to reiterate that we support Alternative 1 and feel that any deviation from this plan would be a mistake.
8	Concord NWS Neighborhood Alliance	The second alternative is not acceptable for residents. Though we do want the process to move forward in order to convey land for a Great Regional Park to the East Bay Regional Parks, local residents prefer less development on the CNWS.
9	Resident	I support the No Action alternative.
10	Resident	I strongly feel that the widening of Denkinger Road and West Street will result in increased traffic volumes and speeds. Extensions of these roads will kill trees and encroach on high school property. I support expansion of the North Concord BART area.
11	Resident	We are in favor of Alternative 1 because we envision 1) walks through this scenic area, 2) friend and family picnic areas, 3) nature watching over the seasons, 4) play areas for baseball, soccer, and other sports, 5) trails for hiking or walking pets. We concur that Alternative 1 will support the necessary funds for developing, advancing, and maintaining this area.
12	Resident	We recommend the site of the current railroad tracks be removed and replaced with an access road.
13	Resident	I support Alternative 1 because it keeps more open space available for wildlife and recreation and because it concentrates development near the North Concord BART station. The hills should be protected as open space as they enhance quality of life for all residents.
14	Resident	If the Navy decides to proceed with Alternative 2, it will bring additional traffic, noise, and air pollution to the neighborhood. Overall, it will reduce the quality of life in the neighborhood and damage the surrounding wildlife habitat.
15	Resident	I prefer that no action be taken on the development. Alternative 2 will result in increased noise and pollution and will greatly affect property values.
16	Resident	We oppose massive building and dense population as it brings increasing traffic and congestion.
17	Resident	Maximize the remaining natural resources on the property by protecting as much land, water etc. by retaining Alternative 1.
18	Resident	Extending West Street or Denkinger would be extremely disastrous for Concord High and the two other schools. Please don't do this.
19	Resident	No action alternative is preferred. We are opposed to Alternative 2.
20	Resident	My wish is for the No Action Alternative and that the Navy keep the property.
21	Resident	We are opposed to high density cluster housing except adjacent to the Bart Station. The Cluster homes become slums in a couple of decades.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
22	Resident	We select the No Action alternative.
Traffic and Transportation		
23	State Agency (California Public Utilities Commission)	The project site area includes active railroad and/or light rail tracks. Railroad crossings engineering section (RCES) recommends that the Navy add language to the Concord NWS so that any future development adjacent to or near the railroad/light rail ROW is planned with the safety of the rail corridor in mind. New developments may increase traffic volumes not only on streets and at intersections, but also at at-grade crossings. This includes considering pedestrian circulation patterns or destinations with respect to railroad ROW and compliance with the Americans with Disabilities Act. Mitigation measures to consider include, but are not limited to, the planning for grade separations for major thoroughfares, improvements to existing at-grade crossings due to increase in traffic volumes and continuous vandal-resistant fencing or other appropriate barriers to limit the access of trespassers onto the railroad ROW.
24	State Agency (California Department of Transportation/Caltrans)	The EIS Section on traffic should reference: 1) Vicinity map, regional location map, and a site plan clearly showing project access in relation to nearby state roadways. Ingress and egress for all project components should be clearly identified. The state ROW should be clearly identified. The maps should also include project driveways, local roads and intersections, parking and transit facilities. 2) Project-related trip generation, distribution and assignment. The assumptions and methodologies used to develop this information should be detailed in the study and supported with the appropriate documentation. 3) Average daily traffic, AM and PM peak hour volumes and LOS on all roadways where potentially significant impacts may occur, including crossroads and controlled intersections for existing, existing plus project, cumulative and cumulative plus project scenarios. Calculation of cumulative traffic volumes should consider all traffic-generating developments, both existing and future, that would affect study area roadways and intersections. The analysis should clearly identify the project's contribution to area traffic and any degradation to existing and cumulative LOS. Caltrans' LOS threshold, which is the transition between LOS C and D, and is explained in detail in the traffic impact study (TIS) guide, should be applied to all state facilities. 4) Schematic illustration of traffic conditions including the project site and study area roadways, trip distribution percentages and volumes as well as intersection geometrics, i.e., lane

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
		configurations, for the scenarios described above. 5) The project site building potential as identified in the City of Concord's 2030 General Plan. The project's consistency with both the Circulation Element of the General Plan and the Congestion Management Agency's Congestion Management Plan should be evaluated. 6) Identification of mitigation for any roadway mainline section or intersection with insufficient capacity to maintain an acceptable LOS with the addition of project-related and/or cumulative traffic. As noted above, the project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should also be fully discussed for all proposed mitigation measures. 7) Identify traffic impact fees for development plans, requiring traffic impact fees that are based on projected traffic and on associated cost estimates for public transportation facilities necessitated by development. 8) Scheduling and costs associated with planned improvements on the state's ROW should be listed, in addition to identifying viable funding sources correlated to the pace of roadway improvements. 9) Cumulative impacts should also be considered where alternatives contemplate work that would affect state ROW such as any transportation or hazardous material on the state ROW, tree removal, seasonal wetlands, and water quality impacts. 10) The Concord, North Concord/Martinez, and Pittsburg/Bay Point BART stations. 11) Bicycle and pedestrian facilities. 12) All traffic impacts not fully studied in the Concord Community Reuse Project Draft EIR.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
25	State Agency (California Department of Transportation/Caltrans)	Identify traffic impact fees to be used for project mitigation. Development plans should require traffic impact fees based on projected traffic and/or based on associated cost estimates for public transportation facilities necessitated by development. Scheduling and costs associated with planned improvements on the state's ROW should be listed, in addition to identifying viable funding sources correlated to the pace of roadway improvements, if any. DOD should work with the city and Transportation partnership and cooperation (TRANSPAC) on the Subregional Transportation Mitigation Program to mitigate and plan for the impact of future growth on the regional transportation system.
26	Local Agency (City of Antioch)	The City of Antioch continues to have significant concerns regarding impacts of a reuse plan on the regional transportation network. It is requested that the EIS also consider and study the impacts and concerns contained in the Transplan Committee's 2009 letter to the City of Concord (attached).
27	Concord NWS Neighborhood Alliance	We are concerned about significant traffic impacts throughout the City of Concord, as well as regional traffic impacts. We are most concerned about traffic impacts on Concord Blvd., especially at the intersections of Bailey Road, Denkinger Road, and West Street. There are 4 schools located in the area of Concord Blvd. between Denkinger Road and West Street. During the school year these schools alone cause major traffic congestion. On rainy days Concord Blvd. in the area of the 4 schools is a parking lot, with major congestion. What will be done to minimize congestion in these areas?
28	Resident	The EIS should evaluate traffic congestion impacts and identify ways to plan for this congestion.
29	Resident	Traffic is already a big problem. There are 4 schools at Denkinger/West Street and Concord Boulevard.
30	Resident	Concerned with traffic impacts on Bailey Road and Landana.
31	Resident	Will there be access to the development from Lynwood Drive?
32	Resident	The extensions of West Street and Denkinger are going to be major access roads and, according to the map (shown at the scoping meeting), look inadequate and dangerous by the 3 public, 1 private school.
33	Resident	Traffic issues are of paramount interest to the community.
34	Resident	Current proposal would destroy the Dana Estates neighborhood by adding connector streets and increasing traffic on local streets.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
35	Resident	My home is the neighborhood adjacent to the North Concord Bart Station where the proposed development is being considered. There is only one exit and one entrance to this property. At commute time our streets are inundated with cars. The cars can either turn right to exit to Highway 4 or empty through our neighborhood to add traffic congestion on our streets. Right now Concord has a population of 122,000 residents. With this new plan the city will add 33,000 residents plus commercial development, which will cause an all-day traffic situation. I hope you have done a complete study of the project and are realistic about the problems involved. I hope you can arrive at a reasonable solution for our residents.
Land Use, Open Space, and Community Facilities/Services		
36	Local Agency (Contra Costa Environmental Health Division)	It is recommended that projects be served by public sewer and city water.
37	Concord NWS Neighborhood Alliance	Residents request that maximum open space be preserved for both active and passive parks. We request no roads east of Mt. Diablo Creek. The area south of Bailey Road should be preserved and protected from development. Residents fully support a large regional park on this site. Seeno/Discovery Homes owns the ridge top and adjacent land; be aware that this area will be developed in the future.
38	Concord NWS Neighborhood Alliance	The Navy should be aware that Seeno/Discovery Homes and other Seeno development companies own the ridge top and the land directly adjacent to the CNWS (in Pittsburg) and have development plans in place. Although this area appears to be open space now, it will be developed.
39	CBO (Contra Costa Building Trades Council IBEW Local 302 and the Central Labor Council)	This property will be used by myself and my entire family when opened up, built out and developed. I look forward to hiking the ridges, visiting family and enjoying nightlife on the former base.
40	Resident	Recreational activities should be non-invasive to wildlife and should include hiking, horseback riding, and bicycling on trails. Motor cross and other active recreational activities should be banned.
41	Resident	Our request would be to preserve as much open space as possible and develop it into parks, recreation areas and walking trails for residents and guests.
42	Resident	We need more open space and a large greenbelt between existing homes. Protect trees that were planted alone fence lines. There are a lot of beautiful 45-year old pine trees. Many families bought their homes because they were told it would always be open space.
43	Resident	The open space area should be protected from the human impacts of air, noise, water, soil and other pollutants and a buffer zone established around the natural lands.
44	Resident	I want to mandate bus routes at 15-minute intervals in the base area and Willow Pass.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
45	Resident	Bunkers or park landscapes are issues that have involved the community.
46	Resident	We desire a good percentage of single-family homes be built to be compatible with the surrounding single-family subdivisions.
Natural Resources		
47	State Agency (California Department of Transportation/Caltrans)	Project level activities related to habitat restoration and management should be done in coordination with local and regional habitat conservation plans and with Caltrans where our programs share stewardship responsibilities for habitats, species, and/or migration routes.
48	CBO (California Native Plant Society)	EBCNPS has designated this area as one of the 15 priority plant protection areas of the East Bay. This large expanse of valley grassland (which occupies most of the site) connects an intact mosaic of saline bayland habitats with uplands that extend into the summits of Mt. Diablo. This crucial strip of land sits in one of the least developed urban watersheds that connects mountains to marshes. The project area being considered in this EIS includes aspects of a native landscape that are worth conserving and restoring.
49	Concord NWS Neighborhood Alliance	Our experiences with California Fish and Game on the CNWS have not been pleasant, e.g.,, removal of elk, tree trimming during nesting season. We request that wildlife and endangered species be preserved, including but not limited to burrowing owls, tiger salamanders, and red-legged frogs. Local residential developers destroy ponds and endangered wildlife, pay a fine and continue building. We do not want to see this type of destruction in the development of the CNWS. All species of wildlife in the CNWS should be preserved.
50	Resident	The EIS should evaluate the impacts of resource preservation or removal.
51	Resident	I hope the elk return and will have a dedicated space.
52	Resident	I would like to see wetlands restored or new wetlands created to create wildlife habitat. All development should be required to use only native plants, grasses, and trees.
53	Resident	We have been fortunate to enjoy the wildlife such as elk, deer, cows, turkeys and a large variety of birds. Please save this beautiful area.
54	Resident	We hate to see the wildlife disappear. This has been a wonderful home for elk, deer, turkeys, coyote. Orioles return to nest every year.
55	Resident	The riparian corridor, inclusive of the 100-year floodplain setback, should be protected from human impact.
Socioeconomics		
56	Federal Agency (EPA)	The DEIS should identify indirect effects that could occur outside the project boundary that is induced by the development within the base boundary, including the potential for population and employment to occur off-base as a result of the project development.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
57	CBO (Contra Costa Building Trades Council IBEW Local 302 and the Central Labor Council)	This piece of land will be the crown jewel of CCC and our members look forward to the build out. Apprentices and journeymen will be involved throughout their careers in the process.
58	Resident	The EIS should evaluate the types of jobs and economic development opportunities associated with the proposed action and should identify the types of skills and education needed to obtain these jobs.
59	Resident	The DEIS should study housing affordability and where the resources will come from for the new transit service. Will local people get jobs? Are there ways to ensure that they do?
60	Resident	I am concerned about property values.
61	Resident	Consider home values. Who would want to purchase my home?
62	Resident	The value of the property cannot help but decrease due to the negatives inherent in the development plan proposed
Quality of Life		
63	Concord NWS Neighborhood Alliance	Stonebrook Convalescent Home is located in the same area. Due to the nature of this business, fire trucks and ambulances visit the facility daily. Although the city's traffic study near Denkinger Rd. and West Streets was not conducted during the peak morning traffic period, it indicated that noise pollution in that area is already beyond acceptable. Adding traffic to these areas will increase the already high air and noise pollution. What will be done to minimize air and noise pollution in the area of Concord Blvd/Denkinger/West Streets?
64	Resident	Air quality and noise are issues.
65	Resident	What is going to happen to the quality of life for homeowners on Willow Pass Road? It appears that traffic will double, based on the proposed housing. Will it be possible to be offered a way out? Please consider traffic control, noise control, etc. for homeowners.
66	Resident	My issue is traffic and quality of life in our neighborhood. Denkinger and West are bad enough now. We do not need an extra burden in the area. If the school district changes its mind and decides to add 400 more students due to the closing of more schools, then widening the streets to accommodate the villages will really impact our lives.
67	Resident	I bought my home largely due to the open space backing up to the homes directly across the street for the serenity and lack of traffic. I do not appreciate that the serenity will be shattered by cutting through Denkinger, increasing traffic, noise, pollution, while decreasing quality of life.
68	Resident	The traffic, noise and pollution would be disastrous and certainly change our lives.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
Air Quality		
69	Federal Agency (EPA)	The DEIS should provide a detailed discussion of ambient air conditions, NAAQS, and criteria pollutant nonattainment areas, and potential air quality impacts (including cumulative and indirect impacts). Emissions should be estimated for the construction and operational phases, and mitigation measures discussed. The DEIS should address the applicability of CAA Section 176 and EPA's general conformity regulations at 40 CFR Parts 51 and 93. The San Francisco Bay Area is designated as nonattainment for NAAQS for particulate matter less than 2.5 microns and for 8-hour ozone and as maintenance area for carbon monoxide. The DEIS should ensure all reasonable mitigation measures have been identified to reduce these pollutants for both the construction and operational phases. Identify mitigation measures that have been adopted in the city's reuse plan and the party responsible for implementation.
70	Federal Agency (EPA)	Climate change is likely to contribute cumulative impacts on some resources, including water, air, and biological resources. The additive impacts from climate changes on resources affected by the project should be discussed. Climate change effects on the project itself, and any recommended adaptation measures, should also be discussed. Additionally, discuss the energy requirements and conservation potential of various alternatives and mitigation measures as required by 40 CFR 1502.16(e). Include a discussion as to whether any part of the energy demand for the development could be met with onsite renewable energy components.
71	Resident	I am concerned about air quality in my neighborhood on Esperanza Drive. We are exposed to wind from two freeways (4 and 242). I am concerned about the dust inside of our dual pane windows.
72	Resident	A hill next to the Bart Station will be leveled and this hill currently helps us not to breathe fumes directly from Freeway 4.
73	Resident	Climate change and GHG emissions are the current fad. This project will make zero difference regardless of the option selected.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
Water Resources/Water Quality		
74	Federal Agency (EPA)	The DEIS should describe and identify all waters of the U.S. that could be affected by the project alternatives, and include maps that clearly identify all waters within the project area. The discussion should include the acreages and channel lengths, habitat types, values and functions of these waters. If a Section 404 permit is required, the project must comply with Federal Guidelines for Specification of Disposal Sites for Dredged or Fill Materials (40 CFR 230). Pursuant to 40 CFR 230, any permitted discharge into waters of the U.S. must be the least environmentally damaging practicable alternative available to achieve the project purpose. If possible, the DEIS should include and craft NEPA alternatives consistent with evaluating project alternatives in this context to demonstrate the project's compliance with the Section 404 guidelines. Since the Corps of Engineers is a cooperating agency for this project, discuss the 404 permit process and the alternatives that will be part of the 404(b)(1) alternatives analysis. If, under the proposed project, dredged or fill material would be discharged into waters of the U.S., the DEIS should discuss alternatives to avoid those discharges.
75	Local Agency (East Bay Municipal Utility District)	The aqueduct's Right-of-Way (R/W) runs parallel to and west of State Highway 242 running north. It then crosses under State Highway 4 and continues north along the eastern toe of Contra Costa Water District's Mallard Reservoir and continues parallel to the Port Chicago Highway and then crosses Port Chicago Highway north of the NWS Concord entry road. Any development within the NWS Concord property has potential to increase encroachment onto the EBMUD aqueduct R/W and impact safety and security of EBMUD facilities. Any development of NWS Concord inland area may impact EBMUD due to increased encroachments onto R/W by utility agencies, the city and developers; and to generate storm water and flooding impacts on the aqueduct's R/W and Clyde Wasteway if drainage impacts are not adequately addressed. The Mt. Diablo Creek, which crosses the aqueducts R/W north of Mallard Reservoir, may be impacted by the increased runoff due to the development within the NWS Concord property and can have potential to increase the creek's flow, thus posing a risk to EBMUD's property and infrastructure.
76	Resident	I am concerned about groundwater contamination.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
Cultural Resources		
77	State Agency (California Department of Transportation/Caltrans)	A project environmental document must include documentation of a current archaeological record from the Northwest Information Center of the California Historical Resources Information System if construction activities are proposed within state ROW. Current record searches must be no more than five years old. The requirements and applicable mitigation must be fulfilled before an encroachment permit can be issued for project-related work in a state ROW; these requirements also apply to NEPA documents when there is a federal action such as on this project. Work subject to these requirements includes, but is not limited to, lane widening, channelization, auxiliary lands, and/or modification of existing features such as slopes, drainage features, curbs, sidewalks and driveways within or adjacent to State ROW.
78	Resident	We wish to see a museum which contains a display of how the NWS Concord served the U.S.A. during World War II.
79	Resident	We should honor our servicemen and women and history of the Naval Weapons Station with tours, monuments, and plaques.
Environmental Management		
80	Federal Agency (EPA)	The DEIS should identify hazardous contaminants that are associated with site parcels and provide general overview of the status of the cleanup pursuant to the CERCLA/Superfund. It is important that the DEIS include information regarding how the proposed development would interface with cleanup remedies. The DEIS should indicate whether the physical development of the proposed action could expose construction workers, visitors, occupants, or ecological systems to potential hazards associated with contaminants. The EPA recommends that the DEIS discuss the proposed land use for each cleanup parcel for each alternative, identify cleanup remedy for that parcel, and describe the proposed development activities that would occur there during construction. The DEIS should discuss how construction activities could come in contact with any contamination that may remain on-site and if/how the development might affect the final remedy. The DEIS should disclose if the development is part of the remedy (i.e., capping). The DEIS should provide an overview of any monitoring that would occur pursuant to the Superfund cleanup, including the party responsible for monitoring.
81	Concord NWS Neighborhood Alliance	Current residents have great concerns about breathing hazardous materials once cleanup and dirt removal begins. How will the Navy deal with hazardous cleanup, and how will we be protected?
82	Resident	We are concerned about the various toxins being released in air in cleanup or leaching through the soil to our irrigation wells when the development begins.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
Infrastructure/Energy		
83	Federal Agency (EPA)	DEIS should identify measures that would be adopted to demonstrate how storm water flows from increases in impervious surfaces will be addressed to prevent flow increases above pre-development levels, consistent with Section 438 of the Energy Independence and Security Act. Refer to Technical Guidance on Section 438 of the Energy Independence and Security Act, which generally focuses on retaining rainfall on-site through infiltration, evaporation/transpiration, and re-use to the same extent as occurred prior to redevelopment. Federal agencies can comply with Section 438 by using a variety of storm water management practices often referred to as green infrastructure or low-impact development practices, including, for example, reducing impervious surfaces, using vegetative practices, porous pavements, cisterns, and green roofs.
84	Resident	The development is an opportunity to install plumbing for recycled water. The appropriate agencies should collaborate to develop a recycled water program for irrigation. The developer should be required to include alternative energy like solar and wind in their development plans.
Noise		
85	Resident	We need a noise study at the intersection of Concord Boulevard and Denkinger/West. With the addition of 15,000 people on the base in three villages, there will be thousands of additional noise makers on these routes past the schools. Also need a noise study at Willow Pass and Landana area.
Required Consultations/Permit Requirements		
86	State Agency (California Department of Transportation/Caltrans)	Caltrans and the CCTA are working on widening the SR4 corridor along with proposed projects at the SR and Interstate (I)-680 interchange. The DOD needs to coordinate their projects with Caltrans, CCTA, and the city. Caltrans has plans for several projects of concern on SR-4 and I-680 in the vicinity of the city including, but not limited to, 1) modifying the interchange between I-680 and SR4, 2) widening SR 4 between Somersville Road and SR 160, and 3) reconstructing the Loveridge road interchange on SR4.
87	State Agency (California Department of Transportation/Caltrans)	If traffic restrictions and detours are needed on or affecting state highways, a transportation management plan (TMP) or construction traffic impact study may be required of the developer prior to construction. TMPs must be prepared in accordance with California Manual on Uniform Traffic Control Devices.
88	State Agency (California Department of Transportation/Caltrans)	Project work that requires movement of oversized or excessive load vehicles on state roadways requires a transportation permit that is issued by Caltrans.

Table 3-3 Summary of Scoping Comments

	Stakeholder Name	Comment
89	State Agency (California Department of Transportation/Caltrans)	Please be advised that any work or traffic control that encroaches onto the state ROW requires an encroachment permit that is issued by Caltrans. Traffic-related mitigation measures should be incorporated into the construction plans prior to the permit process.
90	Local Agency (East Bay Municipal Utility District)	EBMUD has the following additional comments regarding any proposed activity within the aqueduct R/W: zoning shall not be changed on the R/W; any proposed projects or changes to the area in the vicinity of the aqueduct's R/W must be submitted to EBMUD for review, comment and approval and may require permits from EBMUD: no longitudinal encroachments (e.g., drainage ditches, utility lines, pipelines, roads) are permitted within the aqueduct R/W. Various construction mitigation measures must be followed during development (security fencing, required clearance and siting of infrastructure; shutoff valves, gravity drainage, etc.). EBMUD must approve each design and protective/control devices. Additional requirements are outlined in the letter and must be followed prior to construction.
91	Local Agency (Contra Costa Environmental Health Division)	A permit from the CCEHD is required for any well or soil boring prior to commencing drilling activities, including those associated with water supply, environmental investigation and cleanup, or geotechnical investigation.
92	Local Agency (Contra Costa Environmental Health Division)	Any abandoned wells and septic tanks must be destroyed under permit from CCEHD. If the existence of such wells or septic tanks are known in advance or discovered during construction or other activities, these must be clearly marked, kept secure, and destroyed pursuant to CCEHD requirements.
93	Local Agency (Contra Costa Environmental Health Division)	The CCEHD is the local enforcement agency for solid waste facilities, including landfills, closed landfills, transfer stations, and waste tire generators and haulers. There are some closed landfills on the property that may come under the jurisdiction of the local enforcement agency when the property is transferred from federal control.
Miscellaneous Comments		
94	Federal Agency (U.S. Coast Guard)	This letter informs you of Coast Guard activities on adjacent property which may affect your Environmental Impact Statement. Specifically, the Coast Guard has made a preliminary determination that 78 housing units located on the adjacent parcel are excess to our needs. This location is the former U.S. Navy housing area in Concord, CA. The Navy has not completed the NEPA analysis related to the site, and thus has not reached a decision on potential disposal methods.

Table 3-3 Summary of Scoping Comments

Stakeholder Name		Comment
95	Local Agency (City of Concord)	To help expedite the EIS process and ensure consistency between the federal and state analyses we encourage the Navy to use the Final EIR to the maximum degree possible. We note that the analyses associated with traffic impacts and related quality of life impacts on air quality and noise are particularly important to the community and need to be coordinated with the FEIR findings.
96	Local Representative (Dan Helix, Mayor)	Hopefully the approved, unchallenged EIR of the City of Concord can be fully utilized in fulfilling the NEPA requirements so we can accelerate delivering the property to the City.
97	CBO (California Native Plant Society)	We recommend that the Navy utilize as much of the information gained during the CEQA EIR process as possible in order to expedite this secondary review process.
98	CBO (California Native Plant Society)	EBCNPS hopes that federal budget sequestration will not impede this project from moving forward to completion, especially since the majority of the required environmental studies have already been completed as part of the CEQA EIR.
99	CBO (Contra Costa Building Trades Council IBEW Local 302 and the Central Labor Council)	The city has held and continues to have an open and inclusive process for the base development. We have been involved in every step of the way and hope that this continues.
100	Resident	Health impacts of the full build out should be evaluated in the EIS, especially (EJ) areas.
101	Resident	The EIS should describe how weapons will be removed from the site.

BILLING CODE 3510–KD–P

DEPARTMENT OF COMMERCE

National Oceanic and Atmospheric Administration

RIN 0648–XC059

Endangered Species; File No. 17022

AGENCY: National Marine Fisheries Service (NMFS), National Oceanic and Atmospheric Administration (NOAA), Commerce.

ACTION: Issuance of permit.

SUMMARY: Notice is hereby given that the NMFS Pacific Islands Fisheries Science Center (PIFSC; Samuel Pooley, Ph.D., Responsible Party), has been issued a permit to take green (*Chelonia mydas*) and hawksbill (*Eretmochelys imbricata*) sea turtles for purposes of scientific research.

ADDRESSES: The permit and related documents are available for review upon written request or by appointment in the following offices:

Permits and Conservation Division, Office of Protected Resources, NMFS, 1315 East-West Highway, Room 13705, Silver Spring, MD 20910; phone (301) 427–8401; fax (301) 713–0376; and

Pacific Islands Region, NMFS, 1601 Kapiolani Blvd., Rm 1110, Honolulu, HI 96814–4700; phone (808) 944–2200; fax (808) 973–2941;

FOR FURTHER INFORMATION CONTACT: Amy Hapeman or Rosa L. González, (301) 427–8401.

SUPPLEMENTARY INFORMATION: On June 25, 2012, notice was published in the **Federal Register** (77 FR 37877) that a request for a scientific research permit to take green and hawksbill sea turtles had been submitted by the above-named organization. The requested permit has been issued under the authority of the Endangered Species Act of 1973, as amended (ESA; 16 U.S.C. 1531 *et seq.*), and the regulations governing the taking, importing, and exporting of endangered and threatened species (50 CFR parts 222–226).

The PIFSC is authorized to begin long-term monitoring of green and hawksbill sea turtles in the remote U.S. Islands and Territories excluding Hawaii in the Central Pacific to estimate sea turtle abundance, size ranges, health status, habitat use, foraging ecology, local movements, and migration routes. Researchers may capture, examine, measure, flipper and passive integrated transponder tag, weigh, skin and blood sample, and/or attach transmitters on sea turtles before release. Researchers also may collect the carcasses, tissues and parts of dead sea turtles encountered during surveys. The permit is valid for five years.

Issuance of this permit, as required by the ESA, was based on a finding that such permit (1) Was applied for in good faith, (2) will not operate to the disadvantage of such endangered or threatened species, and (3) is consistent with the purposes and policies set forth in section 2 of the ESA.

Dated: March 11, 2013.

P. Michael Payne,

Chief, Permits and Conservation Division, Office of Protected Resources, National Marine Fisheries Service.

BILLING CODE 3510–22–P

DEPARTMENT OF COMMERCE

National Technical Information Service

National Technical Information Service Advisory Board

AGENCY: National Technical Information Service, Commerce.

ACTION: Notice of Open Meeting.

SUMMARY: This notice announces the next meeting of the National Technical Information Service Advisory Board (the Advisory Board), which advises the Secretary of Commerce and the Director of the National Technical Information Service (NTIS) on policies and operations of the Service.

DATES: The Advisory Board will meet on Friday, April 19, 2012 from 9:00 a.m. to approximately 4:30 a.m.

ADDRESSES: The Advisory Board will be held in Room 115 of the NTIS Facility at 5301 Shawnee Road, Alexandria, Virginia 22312. Please note admittance instructions under the **SUPPLEMENTARY INFORMATION** section of this notice.

FOR FURTHER INFORMATION CONTACT: Mr. Bruce Borzino, (703) 605–6405, *bborzino@ntis.gov.*

SUPPLEMENTARY INFORMATION: The NTIS Advisory Board is established by Section 3704b(c) of Title 15 of the United States Code. The charter has been filed in accordance with the requirements of the Federal Advisory Committee Act, as amended (5 U.S.C. App.).

The morning session will focus on a review of NTIS performance in the first half of Fiscal Year 2013. The afternoon session is expected to focus on program plans for the remainder of Fiscal Year 2013. A final agenda and summary of the proceedings will be posted at NTIS Web site as soon as they are available (*http://www.ntis.gov/about/advisorybd.aspx*).

The NTIS Facility is a secure one. Accordingly persons wishing to attend should call the NTIS Visitors Center, (703) 605–6040, to arrange for admission. If there are sufficient expressions of interest, up to one-half hour will be reserved for public comments during the afternoon session. Questions from the public will not be considered by the Board but any person who wishes to submit a written question for the Board's consideration should mail or email it to the NTIS Visitor Center, *bookstore@ntis.gov,* not later than April 10, 2013.

Dated: March 11, 2013.

Bruce Borzino,

Director.

BILLING CODE 3510–04–P

DEPARTMENT OF DEFENSE

Department of the Navy

Notice of Intent To Prepare an Environmental Impact Statement for the Disposal and Reuse of the Naval Weapons Station Seal Beach Detachment Concord, City of Concord, California, and To Announce Public Scoping Meetings

AGENCY: Department of the Navy, DoD.

ACTION: Notice.

SUMMARY: Pursuant to Section 102(2)(c) of the National Environmental Policy Act (NEPA) of 1969, as implemented by the Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500–1508), the Department of the Navy (DoN) announces its intent to prepare an Environmental Impact Statement (EIS)

to evaluate the potential environmental consequences of the disposal and reuse of surplus property at the former Naval Weapons Station Seal Beach Detachment Concord (NWS Concord), Concord, Contra Costa County, California. In accordance with NEPA, before disposing of any real property, the DoN must analyze the environmental effects of the disposal of the NWS Concord property. A 30-day public scoping period is being held to receive comments on the scope of the EIS, including the range of actions, alternatives, and environmental concerns that should be addressed. Public scoping meetings will also be held in the City of Concord, California, to provide information and receive written comments on the scope of the EIS. Federal, state, and local agencies and interested individuals are invited to comment on the scope of the EIS and attend the public scoping meeting.

Dates and Addresses: Two public scoping meetings will be held on Thursday, April 4, 2013 at 4:00–6:00 p.m. and 7:00–9:00 p.m. at the Concord Senior Citizens Center (Wisteria Room), 2727 Parkside Circle, Concord, California, 94519. DoN representatives will be available to provide clarification as necessary related to the EIS. There will not be a formal presentation.

FOR FURTHER INFORMATION CONTACT: Director, NAVFAC BRAC PMO West, Attn: Mr. Ronald Bochenek, 1455 Frazee Road, Suite 900, San Diego, California 92108–4310, telephone 619–532–0906, fax 619–532–9858, email: *ronald.bochenek.ctr@navy.mil*.

For more information on the NWS Concord EIS visit the DoN BRAC PMO Web site (*http://www.bracpmo.navy.mil*).

SUPPLEMENTARY INFORMATION: In 2005, a portion of NWS Concord was designated for closure under the authority of Public Law 101–510, the Defense Base Closure and Realignment Act of 1990, as amended. At the time, the former NWS Concord comprised two major land holdings— (1) the Tidal Area, along Suisun Bay and (2) the Inland Area, within the City of Concord. In 2008, the Tidal Area and 115 acres of the Inland Area were transferred to the U.S. Army and is now the Military Ocean Terminal Concord (6,419 acres in total). In addition, approximately 59 acres of the Inland Area, which supported military housing, was transferred to the U.S. Coast Guard. The remaining 5,038 acres of the Inland Area was declared surplus to the needs of the federal government on May 6, 2007 (72 FR 9935) and its disposal and reuse is the focus of this EIS.

The purpose of the proposed action is the disposal of surplus property at NWS Concord from federal ownership and its subsequent reuse in a manner consistent with the Concord Reuse Project Area Plan, as adopted by the City of Concord on January 24, 2012. The need for the proposed action is to provide the local community the opportunity for economic development and job creation. The DoN is the action proponent for the proposed action. The U.S. Army Corps of Engineers has requested to serve as a Cooperating Agency.

To assess the potential impacts of the proposed action, the DoN will evaluate two property reuse alternatives and a No Action Alternative. Alternative 1 is the reuse of the property in a manner consistent with the Concord Reuse Project Area Plan. Alternative 2 consists of a greater amount of residential and mixed-use development. Alternative 2 includes elements of the Connected Villages Alternative (Alternative 2) assessed in the 2008 Draft Environmental Impact Report of the City of Concord's Reuse Plan conducted in compliance with the California Environmental Quality Act. The No-Action Alternative is evaluated in detail in this EIS as prescribed by CEQ regulations. Both reuse alternatives assume full build-out over a 25-year period; the period of analysis will be during construction and when full build-out has been completed.

Alternative 1 is the disposal and reuse of surplus property at the former NWS Concord in a manner consistent with the Concord Reuse Project Area Plan. Under Alternative 1, approximately 69% of the property would be maintained as conservation, parks, or recreational land uses, and 31% would be mixed-use development, including a mix of office, retail, residential, community facilities, light industrial, and research and development/educational land uses. Development on the site would involve up to a maximum of 12,272 housing units and 6,100,000 square feet of commercial space over a total development footprint of approximately 1,545 acres. The remaining portion of the property would be utilized for conservation, parks, or recreational land uses, including a 2,537 acre regional park, which would encompass the east side of the property along the ridgeline of the Los Medanos Hills. The western side of the property would be developed as a series of mixed-use development districts, with higher development densities at the north end of the property, near State Route 4 and the North Concord/Martinez Bay Area Rapid Transit (BART) station, and lower density residential villages as you move south towards Bailey Road. The development districts would be serviced by local and connector streets and two new through-streets, Los Medanos Boulevard running north/south from the BART station and Delta Road running east/west paralleling Highway 4. In addition, the transportation network will include a high-capacity bus transit service that will connect the development to BART, downtown Concord, and the surrounding neighborhoods.

Alternative 2 would include a greater amount of development throughout the site, as approximately 60% of the property would be maintained as conservation, parks, or recreational land uses, and approximately 40% would be mixed-use development, including a mix of office, retail, hotel, residential, and community/institutional land uses. Development on the site would involve up to a maximum of 13,000 housing units, and 7,900,000 square feet of commercial space over a total development footprint of approximately 2,000 acres. The transportation network will include a high-capacity bus transit service throughout the site connecting the villages to downtown Concord and existing neighborhoods. An arterial road connecting Bailey Road and Willow Pass Road would be included east of Mt. Diablo Creek. Alternative 2 is included for the purposes of the NEPA analysis and does not imply a change to the City of Concord's adopted Area Plan and 2030 General Plan, which is the result of a public planning process. The DoN has no role in the community planning process.

The No Action Alternative is required by NEPA and evaluates the impacts at NWS Concord in the event that the surplus property is not disposed. Under this alternative the property would be retained by the DoN in caretaker status. No reuse or redevelopment would occur under this alternative.

The EIS will address potential direct, indirect, short-term, long-term, and cumulative impacts on the human and natural environments, including but not limited to potential impacts on topography, geology and soils; water resources; biological resources; air quality; greenhouse gases and climate change; noise; infrastructure and utilities; transportation, traffic, and circulation; cultural resources; land use; socioeconomics and environmental justice; hazards and hazardous substances; and public services. Known areas of concern associated with the proposed action include impacts on biological and cultural resources, impacts on local traffic patterns resulting from reuse scenarios, and the

cleanup of installation remediation sites.

The DoN is initiating a 30-day scoping period to receive comments on the scope of the EIS, including the range of actions, alternatives, and environmental concerns that should be addressed. Public scoping meetings will be held in the City of Concord, California, to provide information and receive written comments on the scope of the EIS. Federal, state, and local agencies and interested individuals are encouraged to comment on the scope of the EIS or attend the public scoping meetings. To be most helpful, scoping comments should clearly describe specific issues or topics that the commenter believes the EIS should address.

Comments can be made in the following ways: (1) Written comments at the scheduled public scoping meetings; or (2) written comments mailed to the DoN BRAC PMO address in this notice; or (3) written comments faxed to the DoN BRAC PMO fax number in this notice; or (4) comments submitted via email using the DoN BRAC PMO email address in this notice.

Written comments must be postmarked, faxed, or emailed by midnight Friday, April 19, 2013, and sent to: Director, NAVFAC BRAC PMO West, Attn: Mr. Ronald Bochenek, 1455 Frazee Road, Suite 900, San Diego, California 92108–4310, telephone 619–532–0906, fax 619–532–9858, email: *ronald.bochenek.ctr@navy.mil*.

Requests for special assistance, sign language interpretation for the hearing impaired, language interpreters, or other auxiliary aids for the scheduled public scoping meetings must be sent by mail or email by Friday, March 29, 2013 to the address provided in this notice.

C.K. Chiappetta,

Lieutenant Commander, Office of the Judge Advocate General, U.S. Navy, Federal Register Liaison Officer.

BILLING CODE 3810–FF–P

DEPARTMENT OF DEFENSE

Department of the Navy

Notice of Intent To Prepare the Commonwealth of the Northern Mariana Islands Joint Military Training Environmental Impact Statement/ Overseas Environmental Impact Statement

AGENCY: Department of the Navy, DoD.

ACTION: Notice of intent.

SUMMARY: Pursuant to section (102)(2)(c) of the National Environmental Policy Act (NEPA) of 1969, as implemented by the Council on Environmental Quality Regulations (40 Code of Federal Regulations parts 1500–1508), and Executive Order 12114, and United States (U.S.) Marine Corps NEPA implementing regulations in Marine Corps Order P5090.2A, Marine Corps Forces, Pacific (MARFORPAC), as the Executive Agent designated by the U.S. Pacific Command (PACOM), announces its intent to prepare an Environmental Impact Statement (EIS)/Overseas EIS (OEIS) to evaluate the potential impacts associated with preliminary alternatives for meeting PACOM Service Components' unfilled unit level and combined level military training requirements in the Western Pacific. The proposed action is to establish a series of live-fire and maneuver Ranges and Training Areas (RTAs) within the Commonwealth of the Northern Mariana Islands (CNMI) to meet this purpose.

Existing Department of Defense (DoD) RTAs and support facilities in the Western Pacific, particularly those in the Mariana Islands, are insufficient to support PACOM Service Components' U.S. Code (U.S.C.) Title 10 training requirements for the region. The expansion of existing RTAs and construction of new RTAs will satisfy identified training deficiencies for PACOM forces that are based in or regularly train in the CNMI. These RTAs will be available to U.S. forces and their allies on a continuous and uninterrupted schedule. These RTAs are needed to support ongoing operational requirements, changes to U.S. force structure and geographic positioning of forces, and U.S. training relationships with allied nations.

MARFORPAC, as the Executive Agent, has invited the Federal Aviation Administration (FAA); International Broadcasting Bureau (IBB); U.S. Army Corps of Engineers; National Marine Fisheries Service; U.S. Fish and Wildlife Service; and U.S. Department of Interior, Office of Insular Affairs, to participate as cooperating agencies in the preparation of the EIS/OEIS. MARFORPAC has also developed a Memorandum of Understanding with the military services regarding their support and engagement in the development of the EIS/OEIS.

MARFORPAC encourages governmental agencies, private-sector organizations, and the general public to participate in the NEPA process for the EIS/OEIS. MARFORPAC is initiating the scoping process for the EIS/OEIS with this Notice of Intent (NOI). Scoping assists MARFORPAC in identifying community concerns and specific issues to be addressed in the EIS/OEIS. All interested parties are invited to attend the scoping meetings and are encouraged to provide comments. MARFORPAC will consider these comments in determining the scope of the EIS/OEIS.

DATES: Three public scoping meetings, using an open-house format, will be held on the following dates and locations in the CNMI:

- Wednesday, April 10, 2013, 5:00 p.m. to 8:00 p.m., Dandan Elementary School Cafeteria, Dandan Road, Dandan, Saipan, CNMI 96960
- Thursday, April 11, 2013, 4:00 p.m. to 7:00 p.m., Tinian Gym, San Jose, Tinian, CNMI 96950
- Friday, April 12, 2013, 5:00 p.m. to 8:00 p.m., Carolinian Utt, Garapan, Saipan, CNMI 96960

Concurrent with the NEPA process, MARFORPAC is initiating National Historic Preservation Act Section 106 Consultation to determine the potential effects of the proposed action on historic properties. During each of the above meetings, MARFORPAC will hold Section 106 meetings in a separate area where subject matter experts will explain the Section 106 process and solicit public input on the identification of historic properties and potential effects of the proposed action on historic properties.

Comments on the proposed action and preliminary alternatives may be submitted during the 45-day public scoping comment period. Comments should be postmarked or received by April 29, 2013, Chamorro Standard Time (ChST). There are three ways to submit written comments: (1) providing comments at one of the public scoping meetings; (2) submitting comments through the project Web site: *www.cnmijointmilitarytrainingeis.com*; and (3) mailing comments to the following address: Naval Facilities Engineering Command, Pacific, Attn: EV21, CNMI Joint Military Training EIS/OEIS Project Manager, 258 Makalapa Drive, Suite 100, JBPHH, HI 96860–3134.

FOR FURTHER INFORMATION CONTACT: Please visit the project Web site or contact the CNMI Joint Military Training EIS/OEIS Project Manager by telephone at 808–472–1253 or by email via the project Web site. Please submit requests for special assistance, sign language interpretation for the hearing impaired, or other auxiliary aids needed at the public scoping open house to the Project Manager by March 25, 2013.

SUPPLEMENTARY INFORMATION: The U.S. military is charged with upholding the U.S. Constitution, defending the United

NWS Concord EIS

NOTICE OF INTENT TO PREPARE AN ENVIRONMENTAL IMPACT STATEMENT FOR THE DISPOSAL AND REUSE OF THE NAVAL WEAPONS STATION SEAL BEACH DETACHMENT CONCORD (NWS CONCORD), CITY OF CONCORD, CALIFORNIA, AND TO ANNOUNCE A PUBLIC SCOPING MEETING

Pursuant to the National Environmental Policy Act (NEPA), the Department of the Navy (Navy) announces its intent to prepare an Environmental Impact Statement (EIS) to evaluate the potential environmental consequences associated with the Navy's disposal of surplus federal property at the NWS Concord and its subsequent reuse in a manner consistent with the Concord Reuse Project Area Plan, as adopted by the City of Concord on January 24, 2012. A 30-day public scoping period is being held to receive comments on the scope of the EIS, including the range of actions, alternatives, and environmental concerns that should be addressed. A public scoping meeting will also be held in the City of Concord to provide information and receive written comments on the scope of the EIS. There will not be a formal presentation. Federal, state, and local agencies and interested individuals are invited to comment on the scope of the EIS and attend the public scoping meeting.

The public scoping meeting is scheduled as follows:

Date: Thursday, April 4, 2013

Times: (Session 1) 4:00 - 6:00 p.m.
(Session 2) 7:00 - 9:00 p.m.

Location: Concord Senior Citizens Center (Wisteria Room)
2727 Parkside Circle
Concord, CA 94519

If you cannot attend the public scoping meeting, you may submit written scoping comments via mail, fax, and email. All comments must be postmarked or received by midnight Friday, April 19, 2013, and sent to:

Director, NAVFAC BRAC PMO West
Attn: Mr. Ronald Bochenek
1455 Frazee Road, Suite 900
San Diego, CA 92108-4310

Fax: 619-532-9858

Email: ronald.bochenek.ctr@navy.mil

For more information on the NWS Concord EIS, including the complete text of the Notice of Intent, go to the Navy BRAC PMO Website (http://www.bracpmo.navy.mil/).

SAN DIEGO, CA 92108-4310

Notice of Intent to Prepare an Environmental Impact Statement for the Disposal and Reuse of the Naval Weapons Station Seal Beach Detachment Concord (NWS Concord), City of Concord, California, and to Announce a Public Scoping Meeting

AGENCY: Department of the Navy, DOD.

ACTION: Notice.

SUMMARY: Pursuant to Section 102(2)(c) of the National Environmental Policy Act (NEPA) of 1969, as implemented by the Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508), the Department of the Navy (Navy) announces its intent to prepare an Environmental Impact Statement (EIS) to evaluate the potential environmental consequences of the disposal and reuse of surplus property at the former NWS Concord, Concord, Contra Costa County, California. In accordance with NEPA, before disposing of any real property, the Navy must analyze the environmental effects of the disposal of the NWS Concord property. A 30-day public scoping period is being held to receive comments on the scope of the EIS, including the range of actions, alternatives, and environmental concerns that should be addressed. A public scoping meeting will also be held in the City of Concord, California, to provide information and receive written comments on the scope of the EIS. Federal, state, and local agencies and interested individuals are invited to comment on the scope of the EIS and attend the public scoping meeting.

PUBLIC SCOPING MEETING DATE AND ADDRESS: Two public scoping meeting sessions will be held on Thursday, April 4, 2013, at 4:00 - 6:00 p.m. and 7:00 - 9:00 p.m. at the Concord Senior Citizens Center (Wisteria Room), 2727 Parkside Circle, Concord, California, 94519. Navy representatives will be available to provide clarification as necessary related to the EIS. There will not be a formal presentation.

FOR FURTHER INFORMATION CONTACT: Director, NAVFAC BRAC PMO West, Attn: Mr. Ronald Bochenek, 1455 Frazee Road, Suite 900, San Diego, California 92108-4310, telephone 619-532-0906, fax 619-532-9858, email: ronald.bochenek.ctr@navy.mil.

For more information on the NWS Concord EIS, visit the Navy BRAC PMO Website (http://www.bracpmo.navy.mil/).

SUPPLEMENTARY INFORMATION: In 2005, a portion of NWS Concord was designated for closure under the authority of Public Law 101-510, the Defense Base Closure and Realignment Act (DBCRA) of 1990, as amended. At the time, the former NWS Concord comprised two major land holdings: (1) the Tidal Area, along Suisun Bay and (2) the Inland Area, within the City of Concord. In 2008, the Tidal Area and 115 acres of the Inland Area were transferred to the

U.S. Army and is now the Military Ocean Terminal Concord (6,419 acres in total). In addition, approximately 59 acres of the Inland Area, which supported military housing, was transferred to the U.S. Coast Guard. The remaining 5,038 acres of the Inland Area was declared surplus to the needs of the federal government on May 6, 2007 (72 FR 9935), and its disposal and reuse is the focus of this EIS.

The purpose of the proposed action is the disposal of surplus property at NWS Concord from federal ownership and its subsequent reuse in a manner consistent with the *Concord Reuse Project Area Plan*, as adopted by the City of Concord on January 24, 2012. The need for the proposed action is to provide the local community the opportunity for economic development and job creation. The Navy is the action proponent for the proposed action. The U.S. Army Corps of Engineers has requested to serve as a Cooperating Agency.

To assess the potential impacts of the proposed action, the Navy will evaluate two property reuse alternatives and a No Action Alternative. Alternative 1 is the reuse of the property in a manner consistent with the *Concord Reuse Project Area Plan*. Alternative 2 consists of a greater amount of residential and mixed-use development. Alternative 2 includes elements of the Connected Villages Alternative (Alternative 2), which was assessed in the 2008 Draft Environmental Impact Report (DEIR) of the City of Concord's Reuse Plan, which was conducted in compliance with the California Environmental Quality Act (CEQA). The No Action Alternative will be evaluated in detail in this EIS as prescribed by CEQ regulations. Both reuse alternatives assume full build-out over a 25-year period; the period of analysis will be during construction and when full build-out has been completed.

Alternative 1: Concord Reuse Project Area Plan - Alternative 1 is the disposal and reuse of surplus property at the former NWS Concord in a manner consistent with the *Concord Reuse Project Area Plan*. Under Alternative 1, approximately 69% of the property would be maintained as conservation, parks, or recreational land uses, and 31% would be mixed-use development, including a mix of office, retail, residential, community facilities, light industrial, and research and development/educational land uses. Development on the site would involve up to a maximum of 12,272 housing units and 6.1 million square feet of commercial space over a total development footprint of approximately 1,545 acres. The remaining portion of the property would be utilized for conservation, parks, and recreational land uses, including a 2,537-acre regional park, which would encompass the east side of the property along the ridgeline of the Los Medanos Hills. The western side of the property would be developed as a series of mixed-use development districts, with higher development densities at the north end of the property, near State Route 4 and the North Concord/Martinez Bay Area Rapid Transit (BART) station, and lower density residential villages to the south, towards Bailey Road. The development districts would be serviced by local and connector streets and two new through-streets—Los Medanos Boulevard running north-south from the BART station and Delta Road running east-west paralleling Highway 4. In addition, the transportation network would include a high-capacity bus transit service that would connect the development to BART, downtown Concord, and the surrounding neighborhoods.

Alternative 2: Larger Development Footprint - Alternative 2 would include a greater amount of development throughout the site, as approximately 60% of the property would be maintained as conservation, parks, or recreational land uses, and approximately 40% would be mixed-use development, including a mix of office, retail, hotel, residential, and community/institutional

land uses. Development on the site would involve up to a maximum of 13,000 housing units and 7.9 million square feet of commercial space over a total development footprint of approximately 2,000 acres. The transportation network would include a high-capacity bus transit service throughout the site, connecting the villages to downtown Concord and existing neighborhoods. An arterial road connecting Bailey Road and Willow Pass Road would be included east of Mt. Diablo Creek. Alternative 2 is included for the purposes of the NEPA analysis and does not imply a change to the City of Concord's adopted Area Plan and 2030 General Plan, which is the result of a public planning process. The Navy has no role in the community planning process.

No Action Alternative - The No Action Alternative is required by NEPA and evaluates the impacts at NWS Concord in the event that the surplus property is not disposed. Under this alternative, the property would be retained by the Navy in caretaker status. No reuse or redevelopment would occur under this alternative.

The EIS will address potential direct, indirect, short-term, long-term, and cumulative impacts on the human and natural environments, including but not limited to potential impacts on topography, geology and soils; water resources; biological resources; air quality; greenhouse gases and climate change; noise; infrastructure and utilities; transportation, traffic, and circulation; cultural resources; land use; socioeconomics and environmental justice; hazards and hazardous substances; and public services. Known areas of concern associated with the proposed action include impacts on biological and cultural resources, impacts on local traffic patterns resulting from reuse scenarios, and the cleanup of installation remediation sites.

The Navy is initiating a 30-day scoping period to receive comments on the scope of the EIS, including the range of actions, alternatives, and environmental concerns that should be addressed. A public scoping meeting will be held in the City of Concord, California, to provide information and receive written comments on the scope of the EIS. Federal, state, and local agencies and interested individuals are encouraged to comment on the scope of the EIS or attend the public scoping meeting. To be most helpful, scoping comments should clearly describe specific issues or topics that the commenter believes the EIS should address.

Comments can be made in the following ways:

(1) Written comments at the scheduled public scoping meeting; or

(2) Written comments mailed to the Navy BRAC PMO address in this notice; or

(3) Written comments faxed to the Navy BRAC PMO fax number in this notice; or

(4) Comments submitted via email using the Navy BRAC PMO email address in this notice.

Written comments must be postmarked, faxed, or emailed by midnight Friday, April 19, 2013, and sent to: Director, NAVFAC BRAC PMO West, Attn: Mr. Ronald Bochenek, 1455 Frazee Road, Suite 900, San Diego, California 92108-4310, telephone 619-532-0906, fax 619-532-9858, email: ronald.bochenek.ctr@navy.mil.

Requests for special assistance, sign language interpretation for the hearing impaired, language interpreters, or other auxiliary aids for the scheduled public scoping meeting must be sent by mail or email by Friday, March 29, 2013, to the address provided in this notice.

Appendix C Air Quality Analysis Supporting Information

This page intentionally left blank.

Carbon Monoxide (CO) Hot Spot Analysis

1. Introduction

A carbon monoxide (CO) hot spot modeling analysis was conducted at the 28 intersections considered in the new traffic analysis completed for the Concord NWS EIS (See Chapter 4.11 of the EIS). CO ambient concentrations were estimated at receptors along each intersection using the California Line Source Dispersion Model (CALINE4) model. Concentrations were estimated separately for Alternative 1, Alternative 2, and the No Build Alternative. The modeling incorporated traffic data from new traffic analysis and was conducted based on methodologies outlined in the Bay Area Air Quality Management District's (BAAQMD's) *California Environmental Quality Act Air Quality Guidelines* (BAAQMD 2012) and the California Department of Transportation's (CalTrans's) *Transportation Project-Level Carbon Monoxide Protocol* (Garza, et al. 1997).

2. Model Inputs

The CALINE4 model was used to estimate 1-hour CO concentrations along the intersections considered in the analysis. This section describes the input parameters used for the model.

Run Type

The worst-case wind angle was selected for each model run.

Aerodynamic Roughness Coefficient

The surface roughness coefficient of 100 centimeters (cm) for "suburban" conditions was used as most representative of the project site.

Link Geometry

Traffic was represented as "links" in the model. The links were developed based on intersection configuration. The links extended a minimum of 150 meters (m) from each intersection.

Link Height

The link heights for each intersection were set to zero. However, any highways located near the intersections were given representative heights relative to the intersections.

Mixing Zone Width

The mixing zone for each link was defined as the width of the roadway plus 6 m (3 m on either side of the roadway).

Link Activity

Link activity was based on the maximum hourly traffic volumes for each roadway segment at each intersection as defined the new traffic analysis.

Emission Factors

The EMFAC 2011-PL emission model was used to obtain representative mobile source CO emission factors for roadways in the analysis. The emission factors were based on average speed of 5 miles per hour (mph) and for all fuel types in Contra County, California for Calendar Year 2035.

Wind Speed

A wind speed of 0.5 meters per second (m/s) was used to represent worst-case conditions.

Wind Direction Standard Deviation

A wind direction standard deviation of 5 degrees was used to represent worst-case conditions.

Atmospheric Stability Class

Stability Class 4 (i.e., class D) was used to represent average conditions in the San Francisco Bay Area Air Basin (SFBAAB).

Mixing Height

A mixing height of 300 m was used as the approximately the height of the atmospheric boundary layer.

Ambient Temperature

An ambient temperature of 7.2 degrees Celsius (^{o}C) was used.

Receptor Positions

Receptors were positioned along the edge of the mixing zone for each roadway. The receptors were assigned a height of 1.8 m (5.9 feet)

3. Model Output

CALINE4 output includes estimated 1-hour CO concentrations in units of parts per million (ppm) at the receptor locations input into the model. Estimated 8-hour CO concentrations were calculated by multiplying the highest 1-hour CO concentration estimated by CALINE4 by a persistence factor of 0.7.

The total localized CO concentrations were developed by summing the CALINE4 results with corresponding 1-hour and 8-hour CO ambient background concentrations. Ambient 1-hour and 8-hour CO concentrations recorded from 2004 to 2013 at the Air Quality Monitoring Station 06013002 (located at 2975 Treat Boulevard in Concord, California) were reviewed to determine appropriate background concentrations. The 1-hour and 8-hour CO background concentrations used in the analysis were 2.6 ppm and 1.8, respectively. These values represent the highest 2nd-high CO concentration recorded over the 10-year period examined.

4. Results

The total localized 1-hour and 8-hour CO concentrations were compared to the state 1-hour and 8-hour CO ambient air quality standards (which are at least as stringent as the corresponding National Ambient Air Quality Standards). The results of the CO hot spot analysis indicate that the CO concentrations near the 28 intersections affected by the alternatives would be well below the State CO ambient air quality standards of 9 ppm (8-hour average) and 20 ppm (1-hour average). The results for 1-hour CO and 8-hour CO are presented in Tables 1 and 2, respectively.

Notes:

1. Calculated by multiplying project contribution to maximum 1-Hour CO concentration (CALINE4 output) by urban persistance factor of 0.7.
2. Based on 2nd Maximum 8-Hour CO concentrations observed at Monitoring Station 060130002 (2975 Treat Blvd, Concord, CA). Value is reported is highest value reported from Years 2004 to 2013.
3. Sum of Project Contribution and Background Concentration.

CalEEMod Emission Modeling

1. Introduction

Construction and operational emission estimates associated with each alternative were calculated using the California Emission Estimator Model (CalEEMod). The model is capable of estimating daily and annual emissions of criteria air pollutants and greenhouse gases (GHG) based on project-specific data. CalEEMod calculates unmitigated and mitigated emission estimates based on model inputs, including mitigation measures.

Construction emissions are calculated for each calendar year for which construction activities occur. Operational emissions are calculated for the first year of project operation after the completion of construction activities.

2. Model Inputs

This section describes the input parameters used to estimate construction and operational emissions in CalEEMod.

Period

The CalEEMod cannot estimate emissions past the Year 2035. Therefore, construction activities were assumed to be conducted from 2016 through 2035. All phases, except demolition were assumed to be equal for each year over this 20-year period. The demolition phase was assumed to last only the first five years of construction (2016 to 2021). Construction was assumed to occur on an average of 5 days per week.

Operational emissions are based on project during the last year of construction (2035).

Land Use Type

The land use type, size and population specifications for a project are entered into the model. The land use types that can be input cover a range of residential, educational, recreational, retail, commercial, and industrial uses. The land use types entered into the model were consistent with the description of the alternatives in the project description of the EIS. The land use types and associated specifications as input to the model are summarized in the attached CalEEMod report files.

Construction Equipment Data

CalEEMod uses construction equipment and vehicle profiles are based land use data entered into the model. However, these profiles can be adjusted based on site specific data. For this project, non-road equipment use was adjusted to closer reflect construction equipment assumptions made in the previous CEQA analysis of the project.

Mitigation-Construction

The construction emission estimates incorporated the application of water twice daily to active construction sites as a fugitive dust mitigation measure. Other mitigation measures will be used to reduce fugitive dust and equipment combustion emissions during construction. However, the construction emission estimates do not incorporate all potential mitigation measures as the exact quantification of emission reductions associated of these mitigation mitigations is complicated by the varying nature of construction activities.

Mitigation-Operations

Assumptions and mitigation measures defined in the Area Plan and used in the development of the CAP analysis were included with revised assumptions of the EIS analysis. However, the operational emission estimates in this report do not necessarily incorporate all potential mitigation measures as the exact quantification of these mitigations is not feasible. However, the majority of primary mitigation measures were incorporated and briefly described below and are listed in the attached CalEEMod reports.

Mobile Mitigation

Mitigations to reduce vehicle miles traveled (VMT) from mobile sources included:

- Increase Density
- Increase Diversity
- Improve Walkability Design
- Integrate Below Market Rate Housing
- Improve Pedestrian Network
- Unbundle Parking Cost
- Implement Trip Reduction Program
- Transit Subsidy
- Encourage Telecommuting and Alternative Work Schedules
- Market Commute Trip Reduction Option
- Provide Ride Sharing Program

Energy Mitigation

Mitigation measures to reduce energy use included the goal of exceed existing building energy efficiency standards and utilizing an extensive network of on-site renewable energy sources (i.e., solar panels).

Water and Waste Mitigation

Mitigation measures to reduce water use and waste generation included applying a water conservation strategy, installing low flow toilets, instituting a comprehensive recycling and composting program (estimated to reduce waste by ~60%).

3. Model Results

Construction emissions are calculated for each calendar year for which construction activities occur. Operational emissions are calculated for the first year of project operation after the completion of construction activities. Annual emissions are reported in terms of tons per year for criteria pollutants and or metric tons per year for GHGs. Daily emissions are reported in terms of pounds per day for the summer and winter seasons.

The reported annual PM10 and PM2.5 fugitive dust construction emissions represent the anticipated project activities. However, it should be noted that daily PM10 and PM2.5 fugitive dust construction emissions in the CalEEMod reports are less than anticipated maximum daily emissions of these pollutants.

Concord - Alternative 1

Contra Costa County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	2,550.00	1000sqft	29.00	2,550,000.00	0

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Lot acreage and population based on site-specific data.

Construction Phase - Total days updated based on schedule.

Off-road Equipment - Unit amounts revised based on site specific factors.

Off-road Equipment - Revise equipment types and unit amounts based on site specifics.

Off-road Equipment -

Trips and VMT - Worker and vendor trips for Bldg. Constr. and Arch. Coating updated based on site-specific data.

Grading - Total acres disturbed based site-specifc data.

Woodstoves - Assume no fireplaces and wood stoves

Sequestration -

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation -

Mobile Commute Mitigation - Mitigation added per site specifics.

Energy Mitigation -

Water Mitigation - Mitigation based on site-specific data.

Waste Mitigation -

3.1 Mitigation Measures Construction

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Integrate Below Market Rate Housing

Improve Pedestrian Network

Unbundle Parking Cost

Implement Trip Reduction Program

Transit Subsidy

Encourage Telecommuting and Alternative Work Schedules

Market Commute Trip Reduction Option

Provide Riade Sharing Program

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	4			**Operational Year**	2035

Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Lot acreage and population based on site-specific data.

Construction Phase - Total days updated based on schedule.

Off-road Equipment - Unit amounts revised based on site specific factors.

Off-road Equipment - Revise equipment types and unit amounts based on site specifics.

Off-road Equipment -

Trips and VMT - Worker and vendor trips for Bldg. Constr. and Arch. Coating updated based on site-specific data.

Grading - Total acres disturbed based site-specifc data.

Woodstoves - Assume no fireplaces and wood stoves

Sequestration -

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation -

Mobile Commute Mitigation - Mitigation added per site specifics.

Energy Mitigation -

Water Mitigation - Mitigation based on site-specific data.

Waste Mitigation -

3.1 Mitigation Measures Construction

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Integrate Below Market Rate Housing

Improve Pedestrian Network

Unbundle Parking Cost

Implement Trip Reduction Program

Transit Subsidy

Encourage Telecommuting and Alternative Work Schedules

Market Commute Trip Reduction Option

Provide Riade Sharing Program

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	58
Climate Zone	4			**Operational Year**	2035

Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Lot acreage and population based on site-specific data.

Construction Phase - Total days updated based on schedule.

Off-road Equipment - Unit amounts revised based on site specific factors.

Off-road Equipment - Revise equipment types and unit amounts based on site specifics.

Off-road Equipment -

Trips and VMT - Worker and vendor trips for Bldg. Constr. and Arch. Coating updated based on site-specific data.

Grading - Total acres disturbed based site-specifc data.

Woodstoves - Assume no fireplaces and wood stoves

Sequestration -

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation -

Mobile Commute Mitigation - Mitigation added per site specifics.

Energy Mitigation -

Water Mitigation - Mitigation based on site-specific data.

Waste Mitigation -

3.1 Mitigation Measures Construction

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Integrate Below Market Rate Housing

Improve Pedestrian Network

Unbundle Parking Cost

Implement Trip Reduction Program

Transit Subsidy

Encourage Telecommuting and Alternative Work Schedules

Market Commute Trip Reduction Option

Provide Riade Sharing Program

3.1 Mitigation Measures Construction

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Integrate Below Market Rate Housing

Improve Pedestrian Network

Unbundle Parking Cost

Implement Trip Reduction Program

Transit Subsidy

Encourage Telecommuting and Alternative Work Schedules

Market Commute Trip Reduction Option

Provide Riade Sharing Program

3.1 Mitigation Measures Construction

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Integrate Below Market Rate Housing

Improve Pedestrian Network

Unbundle Parking Cost

Implement Trip Reduction Program

Transit Subsidy

Encourage Telecommuting and Alternative Work Schedules

Market Commute Trip Reduction Option

Provide Riade Sharing Program

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Lot acreage and population based on site-specific data.

Construction Phase - Total days updated based on schedule.

Off-road Equipment - Unit amounts revised based on site specific factors.

Off-road Equipment -

Off-road Equipment - Additonal equipment and revised unit amounts based on site specfics.

Off-road Equipment -

Trips and VMT - Worker and vendor trips for Bldg. Constr. and Arch. Coating updated based on site-specific data.

Grading - Total acres disturbed based site-specifc data.

Woodstoves - Updated based on site specific data.

Sequestration -

Construction Off-road Equipment Mitigation -

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Energy Mitigation -

Water Mitigation - Mitigation based on site-specific data.

Waste Mitigation -

3.1 Mitigation Measures Construction

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Integrate Below Market Rate Housing

Improve Pedestrian Network

Unbundle Parking Cost

Implement Trip Reduction Program

Transit Subsidy

Encourage Telecommuting and Alternative Work Schedules

Market Commute Trip Reduction Option

Provide Riade Sharing Program

Appendix D-1 Special Status Plant Species Considered for Potential Occurrence on the Former NWS Concord

Scientific Name	Common Name	Federal/State Listing Status	Habitat Description and Elevation	Potential to Occur
Amsinckia grandiflora	large-flowered fiddleneck	FE/SE	Found in cismontane woodland, valley and foothill grassland from 270-550m	**Unlikely.** Suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).
Arctostaphylos pallida	pallid manzanita	FT/SE	Found in broad-leaved upland forest, closed-cone coniferous forest, chaparral, cismontane woodland, and coastal scrub from 186-485m.	Absent. No suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).
Chloropyron molle ssp. *molle* (formerly *Cordylanthus mollis ssp. mollis* -)	soft bird's-beak	FE/SR	Occurs in coastal marsh from 1-10m.	Absent. No suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).
Chorizanthe robusta var. *robusta*	robust spineflower	FE/None	Found in maritime chaparral, cismontane woodland, coastal dunes, and coastal scrub from 3-300m.	Absent. No suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).
Clarkia franciscana	Presidio clarkia	FE/SE	Occurs in coastal scrub and valley and foothill grassland from 25-335m.	Absent. No suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).
Cordylanthus nidularius	Mt. Diablo bird's-beak	None/SR	Found in chaparral from 600-800m.	Unlikely. Suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).

Appendix D-1 Special Status Plant Species Considered for Potential Occurrence on the Former NWS Concord

Scientific Name	Common Name	Federal/State Listing Status	Habitat Description and Elevation	Potential to Occur
Erysimum capitatum var. angustatum	Contra Costa wallflower	FE/SE	Occurs on inland dunes from 3-20m. Known only from the Antioch Dunes.	Absent. No suitable habitat present. Not identified during special status plant surveys.
Holocarpha macradenia	Santa Cruz tarplant	FT/SE	Found in coastal prairie and valley and foothill grassland from 10-260m.	Unlikely. Suitable habitat present. Not identified during special status plant surveys (City of Concord 2012).
Lasthenia conjugens	Contra Costa goldfields	FE/None	Found in open, grassy areas in valley-foothill grasslands, vernal pools, and cismontane woodland from 1-445m.	Unlikely. Suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).
Lilaeopsis masonii	Mason's lilaeopsis	None/SR	Occurs in freshwater and brackish marshes and riparian scrub from 0-10m.	Absent. No suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).
Neostapfia colusana	Colusa grass	FT/SE	Occurs in vernal pools in valley grassland, freshwater wetlands, and wetland-riparian communities. 5-215m.	Absent. No suitable habitat present. Not identified during special status plant and vernal pool surveys (City of Concord 2010 and 2012).
Oenothera deltoides ssp. howellii	Antioch Dunes evening-primrose	FE/SE	Occurs on inland dunes from 0-30m.	Absent. No suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).

Appendix D-1 Special Status Plant Species Considered for Potential Occurrence on the Former NWS Concord

Scientific Name	Common Name	Federal/State Listing Status	Habitat Description and Elevation	Potential to Occur
Plagiobothrys diffusus	San Francisco popcornflower	None/SE	Found in coastal prairie and valley and foothill grassland from 60-360m.	Unlikely. Suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).
Sanicula maritima	adobe sanicle	None/SR	Found in chaparral, coastal prairie, meadows and seeps, valley and foothill grassland on clay soils and serpentinite from 30-240m.	Unlikely. Suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).
Sanicula saxatilis	rock sanicle	None/SR	Occurs in broad-leafed upland forest, chaparral, and valley and foothill grassland on rocky soils from 620-1,175m.	Unlikely. Suitable habitat present. Not identified during special status plant surveys (City of Concord 2010 and 2012).
Sidalcea keckii	Keck's checkerbloom	FE/None	Found in serpentine soils in valley grassland and foothill woodlands from 80-700m.	Absent. No suitable habitat present. Serpentine soils are not present within the former NWS Concord. Not identified during special status plant surveys.

Key:
FE = federal endangered
FT = federal threatened
SR = state rare

This page intentionally left blank.

Appendix D-2 Special Status Wildlife with Potential to Occur on the Former NWS Concord

Species	Scientific Name	Federal/State Listing Status	Habitat	Potential to Occur
Invertebrates				
Bay checkerspot bufferfly	*Euphydryas editha bayensis*	FT/None	Restricted to native grasslands on outcrops of serpentine soil in the vicinity of San Francisco Bay. *Plantago erecta* is primary host plant.	**Absent.** No suitable habitat present.
California freshwater shrimp	*Syncaris pacifica*	FE/SE	Found in perennial freshwater streams in Marin, Sonoma, and Napa counties.	**Absent.** Outside known range for this species.
Callippe silverspot butterfly	*Speyeria callippe callippe*	FE/None	Restricted to the northern coastal scrub of the San Francisco peninsula.	**Absent.** Outside known range for this species.
Conservancy fairy shrimp	*Branchinecta conservatio*	FE/None	Endemic to the grasslands of the northern two-thirds of the Central Valley; found in large, turbid pools.	**Absent.** Outside known range for this species.
Delta green ground beetle	*Elaphrus viridis*	FT/None	Found along margins of vernal pools in Solano County.	**Absent.** Outside known range for this species.
Lange's metalmark butterfly	*Apodemia mormo langei*	FE/None	Inhabits stabilized dunes along the San Joaquin River. Endemic to Antioch Dunes, Contra Costa County.	**Absent.** Outside known range for this species.
Longhorn fairy shrimp	*Branchinecta longiantenna*	FE/None	Found in grass-bottomed pools and clear-water sandstone vernal pools.	**Absent.** Not detected in protocol-level surveys.
San Bruno elfin butterfly	*Callophrys mossii bayensis*	FE/None	Found in coastal, mountainous areas with grassy ground cover, mainly in the vicinity of San Bruno Mountain in San Mateo County.	**Unlikely.** No CNDDB occurrences within 5 miles of the former NWS Concord. Unknown if host plants are present.

Appendix D-2 Special Status Wildlife with Potential to Occur on the Former NWS Concord

Species	Scientific Name	Federal/State Listing Status	Habitat	Potential to Occur
Valley elderberry longhorn beetle	*Desmocercus californicus dimorphus*	FT/None	Found only on elderberry bushes in moist valley oak woodlands along the margins of rivers and streams in the lower Sacramento and lower San Joaquin River Valleys.	**Unlikely.** Outside known range for this species.
Vernal pool fairy shrimp	*Branchinecta lynchi*	FT/None	Inhabit small, clear-water sandstone-depression pools and grassed swale, earth slump, or basalt-flow depression pools.	**Absent.** Not detected in protocol-level surveys.
Vernal pool tadpole shrimp	*Lepidurus packardi*	FE/None	Found in grass or mud-bottomed swales in grasslands on alluvial soils underlain by hardpan.	**Absent.** Not detected in protocol-level surveys.
Fish				
Central California coast coho salmon	*Oncorhynchus kisutch*	FE/SE	Found in cool freshwater streams with adequate pool and riffle depths, moderate velocities, and clean spawning gravels. Prefer short, lower sections of larger coastal drainages.	**Absent.** No suitable habitat present.
Central California coast steelhead	*Oncorynchus mykiss*	FT/None	Found in cool freshwater streams with adequate pool and riffle depths, moderate velocities, and clean spawning gravels.	**Absent.** No suitable habitat present.
Central Valley steelhead	*Oncorynchus mykiss*	FT/None	Found in cool freshwater streams with adequate pool and riffle depths, moderate velocities, and clean spawning gravels.	**Absent.** No suitable habitat present.

Appendix D-2 Special Status Wildlife with Potential to Occur on the Former NWS Concord

Species	Scientific Name	Federal/State Listing Status	Habitat	Potential to Occur
Central Valley spring-run chinook salmon, winter-run chinook salmon (Sacramento River)	*Oncorhynchus tshawytscha*	FT/ST	Found in cool freshwater streams in the Sacramento Valley with adequate pool and riffle depths, moderate velocities, and clean spawning gravels.	**Absent.** No suitable habitat present.
Sacramento River winter-run Chinook salmon	*Oncorhynchus tshawytscha*	FE/SE	Found in brackish, shallow lagoons with slow-moving water and salinities between 0 and 10 parts per thousand.	**Absent.** No suitable habitat present.
Delta smelt	*Hypomesus transpacificus*	FT/SE	Found in euryhaline (mixed fresh and salt water) zone within the delta where salinity is approximately 2 parts per thousand.	**Absent.** No suitable habitat present.
Green sturgeon	*Acipenser medirostris*	FT/None	Found in large rivers with swift, deep water and clean sand and cobble substrates.	**Absent.** No suitable habitat present.
Longfin smelt	*Spirinchus thaleichtys*	None/ST	Spawn in fresh water in the upper San Francisco Bay and Sacramento-San Joaquin Delta.	**Absent.** No suitable habitat present.
Tidewater goby	*Eucyclogobius newberryi*	FE/None	Found in cool freshwater streams in the Sacramento River and tributaries with adequate pool and riffle depths, moderate velocities, and clean spawning gravels.	**Absent.** No suitable habitat present.

Appendix D-2 Special Status Wildlife with Potential to Occur on the Former NWS Concord

Species	Scientific Name	Federal/State Listing Status	Habitat	Potential to Occur
Amphibians				
California red-legged frog	*Rana draytonii*	FT/None	This large, aquatic frog requires deep seasonal pools with riparian vegetation for breeding. Individuals are known to move long distances between water bodies. Lack of access to upland refugia, such as small mammal burrows, is considered a limiting factor for this species.	**Present**. Individuals were observed in Cistern Pond, upper Cistern Pond, and several locations along Mt. Diablo Creek.
California tiger salamander	*Ambystoma californiense*	FT/ST	Occurs primarily in grassland habitats. Requires seasonal pools, especially those that retain water until May or June, for breeding and egg-laying. This species spends most of its life underground in small mammal burrows.	**Present**. Individuals were observed in nine seasonal wetlands and ponds within the southeastern portion of the former NWS Concord, according to surveys conducted in 1999. No suitable habitat is present northwest of Willow Pass Road.
Reptiles				
Alameda whipsnake	*Masticophis lateralis euryxanthus*	FT/ST	Found in coastal scrub and chapparal communities but will forage in grasslands and open woodlands. Requires access to rock crevices or small mammal burrows for refuge.	**Unlikely**. No suitable breeding habitat exists within the former NWS Concord. However, small areas of suitable foraging habitat occur southeast and northwest of Bailey Road.
Giant garter snake	*Thamnophis gigas*	FT/ST	Highly aquatic snake found in freshwater marsh and low-gradient streams in the San Joaquin and Sacramento River Delta but has adapted to drainage canals and irrigation ditches.	**Unlikely.** Wetlands and drainages within the former NWS Concord are not extensive enough to provide suitable habitat for this species.

Appendix D-2 Special Status Wildlife with Potential to Occur on the Former NWS Concord

Species	Scientific Name	Federal/State Listing Status	Habitat	Potential to Occur
Birds				
Bald eagle	*Haliaeetus leucocephalus*	BGEPA/SE	Large, distinctive eagle. Nests in mature and old-growth forest adjacent to large bodies of water.	**Unlikely**. A single juvenile bald eagle was observed during surveys in 1982. Individuals may forage over the former NWS Concord, but this species is not expected to breed onsite.
California black rail	*Laterallus jamaicensis coturniculus*	None/ST	Inhabits freshwater marshes, wet meadows, and shallow margins of saltwater marshes bordering larger bays. Needs water depth of about 1 inch that does not fluctuate during the year and dense vegetation for nesting habitat.	**Unlikely.** No suitable habitat exists within the former NWS Concord.
California clapper rail	*Rallus longirostris obsoletus*	FE/SE	Occurs only within the tidal salt and brackish marshes around San Francisco Bay.	**Absent.** No suitable habitat exists within the former NWS Concord.
California least tern	*Sternula antillarum browni* (formerly known as *Sterna antillarum browni*)	FE/SE	Nests along the coast from San Francisco Bay south to northern Baja, California. Colonial breeder on bare or sparsely vegetated, flat substrates such as sand beaches, alkali flats, landfills, or paved areas.	**Absent.** No suitable breeding habitat exists within the former NWS Concord.
Golden eagle	*Aquila chrysaetos*	BGEPA/None	Found in rolling foothills, mountain areas, sage-juniper flats, and desert. Cliff-walled canyons and large trees in open areas provide nesting habitat.	**Present**. A breeding pair nests annually along the eastern boundary of the former NWS Concord.

Appendix D-2 Special Status Wildlife with Potential to Occur on the Former NWS Concord

Species	Scientific Name	Federal/State Listing Status	Habitat	Potential to Occur
Peregrine falcon	*Falco peregrinus anatum*	None/SE	A fairly rare perennial visitor throughout cismontane California. Nests on rocky outcrops and cliffs, or on tall buildings in urban areas. Foraging habitat typically includes a variety of coastal and interior wetland communities, as well as open areas such as airports and farmland.	**Unlikely**. The CRP FEIR lists this species as present within the proposed action area. However, while this species may forage occasionally within the former NWS Concord, no suitable nesting habitat for this species is onsite.
Swainson's hawk	*Buteo swainsoni*	None/ST	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, grasslands, and agricultural or ranch lands with groves or lines of trees. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields with abundant rodents.	**Unlikely**. Suitable habitat exists within the former NWS Concord, but this species is likely only to forage and not breed.
Western snowy plover	*Charadrius alexandrinus nivosus*	FT/None	Nests on sandy beaches and on the shores of salt ponds and alkali lakes. Needs sandy, gravelly, or friable soils for nesting.	**Unlikely**. No suitable breeding habitat exists within the former NWS Concord.
Mammals				
Salt marsh harvest mouse	*Reithrodontomys raviventris*	FE/SE	Found only in tidal marsh of San Francisco Bay and its tributaries. Pickleweed is a primary habitat component.	**Unlikely**. No suitable habitat exists within the former NWS Concord.

Appendix D-2 Special Status Wildlife with Potential to Occur on the Former NWS Concord

Species	Scientific Name	Federal/State Listing Status	Habitat	Potential to Occur
San Joaquin kit fox	*Vulpes macrotis mutica*	FE/SE	Found in annual grassland with scattered shrubs. Needs looselytextured, friable soil for burrowing and an adequate prey base of small mammals.	**Absent.** While suitable habitat is present within the former NWS Concord, the species has not been observed during extensive survey efforts.

Sources: CNDDB 2014 and USFWS 2014.

Status explanations:
Federal

FE = Listed as endangered under the federal Endangered Species Act.
FT = Listed as threatened under the federal Endangered Species Act.
BGEPA = Protected under the Bald and Golden Eagle Protection Act.

State
SE = Listed as endangered under the California Endangered Species Act.
ST = Listed as threatened under the California Endangered Species Act.
SC = California Department of Fish and Wildlife species of special concern.

Potential to Occur:

Likely = Per CNDDB and/or professional expertise specific to the former NWS Concord, individuals of the species are likely to colonize or use the area because data show that individuals of the species are known to occur within 5 miles of the former NWS Concord and ideal habitat is within the former NWS Concord.

Unlikely = Occurrence of this species has been identified in the CNDDB records, but either the recorded observations are more than 10 years old, key habitat requirements are absent, or the habitat on the former NWS Concord is so degraded, small, or isolated that it would be very unlikely for individuals of the species to colonize or use the area.

Table E-1 Summary of Solid Waste Management Unit Sites

Site Number	Site Name	Program Activity: Key Activity	Program Activity: Date Completed	Description and Current Status	Constituents of Concern
SWMUs Recommended for No Further Action in 1992					
• SWMU 3 • SWMU 4 • SWMU 6 • SWMU 8 • SWMU 9 • SWMU 10 • SWMU 11	• Building IA-8, Explosives Ordnance Disposal Detachment • Building IA-10, Print Shop • Building IA-15, Automotive Vehicle Maintenance Division • Building IA-20, Chemical Laboratory • Building IA-21, Material Test Laboratory • Building IA-21A, Evaluation Laboratory • Building IA-22, Photography Laboratory	RFA	1992	Various site descriptions; see historical records. 1992 RFA report recommended NFA, and no additional investigations were conducted under RCRA. Some sites received additional regulatory action under RCRA; e.g., for SWMU 11, the RCRA-permitted photographic silver recovery unit received DTSC closure in 1999. Some sites were later investigated under other programs; e.g., SWMU 8, Building IA-20 Chemical Laboratory, was later investigated as part of IRP Site 27 (see Table 3.8-1). SWMU 32, UST 5AT, was later investigated under the UST Program (see Table E-2).	Depending on the site, common constituents of concern included oil, petroleum hydrocarbons, metals, VOCs, chemicals from paints, solvents, acids, bases, coolant, and photographic chemicals
• SWMU 19 • SWMU 21 • SWMU 27 • SWMU 28 • SWMU 29 • SWMU 31 • SWMU 32	• Building IA-54, Electric Substation • Building IA-58, X-Ray Building • Building 193, Auto Hobby Shop • Building 263, Ordnance Maintenance • Building 429, Hazardous Waste Accumulation Shed • Diesel Leak Near Main Entrance of Inland Area • UST 5AT	NFA recommended	1992		

Table E-1 Summary of Solid Waste Management Unit Sites

Site Number	Site Name	Program Activity: Key Activity	Program Activity: Date Completed	Description and Current Status	Constituents of Concern
SWMUs Transferred to ER Program					
• SWMU 2 • SWMU 5 • SWMU 7 • SWMU 18	• Building IA-7 Burn Pit near Fire Station • Building IA-12, Locomotive Repair Shop, and Building 269, Wash Station • Building IA-15, Public Works Shop and Automotive Vehicle Maintenance, and Building IA-16, Paint Shop • Building IA-51, Vehicle Maintenance Building	RFA	1992	See Table 3.8-1	See Table 3.8-1
		RFA Confirmation Study	1997		
		SWMUs transferred to ER Program	After 1997		
Other SWMUs					
SWMU 1	Building IA-6, Boiler House	RFA	1992	UST removed on 6/29/89. Petroleum-only site was transferred to UST program to complete the cleanup following the RFA Confirmation Study (see Table E-2). Boiler house demolished in 1997. RWQCB closure issued on 6/16/06.	Diesel fuel oil
		RFA Confirmation Study	1997		
		Transferred to UST program	After 1997		
		NFA; site closed	2006		
SWMU 12	Building IA-24, Forklift Maintenance and Storage (septic system)	RFA	1992	Septic tank waste removed in 1997. RFA Confirmation Study and RCRA Corrective Action Program reports recommended NFA. Septic tank decommissioned in place in 2005. Remainder of site was addressed and closed as IRP Site 17 (see Table 3.8-1).	Metals, fuel and oil constituents
		RFA Confirmation Study	1997		
		RCRA Corrective Action Program activities	1997		
		NFA recommended (septic system)	1997		
SWMU 13	Building IA-25, Missile Component Maintenance (septic system)	RFA	1992	Septic tank waste removed in 1997 under RCRA Corrective Action. RFA Confirmation Study and RCRA Corrective Action Program reports recommended NFA. Remainder of site is being addressed as IRP Site 29 (see Table 3.8-1).	Chlorinated hydrocarbons (especially TCE) and metals
		RFA Confirmation Study	1997		
		RCRA Corrective Action Program activities	1997		
		NFA recommended (septic system)	1997		

Table E-1 Summary of Solid Waste Management Unit Sites

Site Number	Site Name	Program Activity		Description and Current Status	Constituents of Concern
		Key Activity	Date Completed		
SWMU 14	Building IA-27, Carpenter Shop	RFA	1992	Septic tank waste removed in 1997. RFA Confirmation Study and RCRA Corrective Action Program reports recommended NFA. Septic tank decommissioned in place in 2005.	Metals, chemicals from paints
		RFA Confirmation Study	1997		
		RCRA Corrective Action Program activities	1997		
		NFA recommended	1997		
SWMU 15	Building IA-41, Paint Storage	RFA	1992	Building IA-41 has been demolished. RFA Confirmation Study report recommended NFA because the building was determined to not have had a septic system.	Metals
		RFA Confirmation Study	1997		
		NFA recommended	1997		
SWMU 16	Building IA-46, Public Works Maintenance Storage, and Building 150, storage shed	RFA	1992	Pesticide-contaminated (mostly DDT) soils removed under 1997 RCRA Corrective Action. RFA Confirmation Study and RCRA Corrective Action Program reports recommended NFA. RCRA Part B clean-closure issued by DTSC on 6/27/03 for past fluorescent-bulb-crushing operations in Building IA-46. Septic tank decommissioned in place in 2005.	Mercury, asbestos, pesticides
		RFA Confirmation Study	1997		
		RCRA Corrective Action Program activities	1997		
		NFA recommended	1997		
		RCRA Part B clean-closure (fluorescent bulb crushing)	2003		
SWMU 17	Building IA-50, Rail/Truck Transfer Depot	RFA	1992	Septic tank waste removed in 1997. RFA Confirmation Study and RCRA Corrective Action Program reports recommended NFA. Septic tank decommissioned in place in 2005.	Metals, VOCs, chemicals from paints
		RFA Confirmation Study	1997		
		RCRA Corrective Action Program activities	1997		
		NFA recommended	1997		
SWMU 20	Building IA-55, Ordnance Operations Building	RFA	1992	Septic tank waste removed in 1997. RFA Confirmation Study and RCRA Corrective Action Program reports recommended NFA. Septic tank decommissioned in place in 2005.	Metals, VOCs
		RFA Confirmation Study	1997		
		RCRA Corrective Action Program activities	1997		
		NFA recommended	1997		
SWMU 22	Building 81, Ordnance Maintenance and Test Building (septic system)	RFA	1992	Septic system was the focus. RFA Confirmation Study report recommended NFA. Septic tank decommissioned in place in 2005. Remainder of site is being addressed as IRP Site 42 (see Table 3.8-1).	Unspecified hazardous constituents (could include chemicals from paints)
		RFA Confirmation Study	1997		
		NFA recommended (septic system)	1997		

Table E-1 Summary of Solid Waste Management Unit Sites

Site Number	Site Name	Program Activity		Description and Current Status	Constituents of Concern
		Key Activity	Date Completed		
SWMU 23	Building 87, Storage Building	RFA	1992	Septic tank waste removed in 1997. RFA Confirmation Study and RCRA Corrective Action Program reports recommended NFA. Septic tank decommissioned in place in 2005.	Solvents, oil, chemicals from paints
		RFA Confirmation Study	1997		
		RCRA Corrective Action Program activities	1997		
		NFA recommended	1997		
SWMU 24	Building 93, Guided Missile Division (septic system)	RFA	1992	Septic tank waste removed in 1997. RFA Confirmation Study and RCRA Corrective Action Program reports recommended NFA. Septic tank decommissioned in place in 2005. Other portions of the site (e. g. leach field) were subsequently addressed for munitions constituents as an AOPI under a CERLCA SI, which recommended NFA.	Solvents, chemicals from paints
		RFA Confirmation Study	1997		
		RCRA Corrective Action Program activities	1997		
		NFA recommended (septic tank)	1997		
		NFA recommended (leach field)	2013		
SWMU 25	Building 97, Ordnance Assembly Building	RFA	1992	Septic system was the focus. RFA Confirmation Study report recommended NFA. Septic tank decommissioned in place in 2005. Four USTs removed in 1990 under UST program (see Table E-2).	Solvents, oil, chemicals from paints
		RFA Confirmation Study	1997		
		NFA recommended	1997		
SWMU 26	Building 178, Navy Exchange Gasoline Service Station	RFA	1992	Four USTs were removed in 1991 under UST program (see Table E-3). CCHS determination of NFA on 5/28/98. RWQCB closure issued on 12/23/99. Site also addressed under CERCLA Navy CLEAN program.	Petroleum constituents
		Transferred to UST program	1991		
		NFA	1998		
		Site closed	1999		

Table E-1 Summary of Solid Waste Management Unit Sites

Site Number	Site Name	Program Activity		Description and Current Status	Constituents of Concern
		Key Activity	Date Completed		
SWMU 30	Unocal Corporation Oil Pipeline Site	Unocal submitted closure report	1991	1989 release of approximately 84 gallons of crude oil that affected soil and groundwater. 1,900 cubic yards of contaminated soil were removed. Unocal completed soil and groundwater investigation, removed contaminated soil under RWQCB direction, and submitted closure report in 1991. RWQCB recommended NFA in 2016. Site recently investigated for munitions and explosives of concern under ER Program (see Section 3.8.3.3.1).	Crude oil
		DTSC recommended RFI	1992		
		NFA recommended	2016		
SWMU 33	UST 6LC98, Magazine Boiler	RFA	1992	UST removed in 1993 under UST program (see Table E-2). CCHS determination of NFA on 6/1/95. RWQCB determination of NFA on 6/16/06.	Diesel fuel oil
		Transferred to UST program	After 1992		
		NFA	1995, 2006		
SWMU 51	Building IA-56	RFA Confirmation Study	1997	Septic system was the focus. RFA Confirmation Study report recommended NFA. Septic tank decommissioned in place in 2005.	Unspecified hazardous constituents
		NFA recommended	1997		
SWMU 52	Building 7SH5 (septic system)	RFA Confirmation Study	1997	Septic system was the focus. RFA Confirmation Study report recommended NFA. Septic tank decommissioned in place in 2005. Remainder of site is being addressed as part of IRP Site 22 (see Table 3.8-1).	Solvents, metals
		NFA recommended (septic system)	1997		
SWMU 53	Building 7SH14	RFA Confirmation Study	1997	Septic system was the focus. RFA Confirmation Study report recommended NFA. Septic tank decommissioned in place in 2005.	Solvents, metals
		NFA recommended	1997

Site Number	Site Name	Program Activity		Description and Current Status	Constituents of Concern
		Key Activity	Date Completed		
SWMU 54	Building 79	RFA Confirmation Study	1997	Septic system was the focus. Septic tank waste removed in 1997. RFA Confirmation Study and RCRA Corrective Action Program reports recommended NFA. Septic tank decommissioned in place in 2005.	Unspecified hazardous constituents
		RCRA Corrective Action Program activities	1997		
		NFA recommended	1997		

CH2M Hill 1997; City of Concord 2010; DTSC 1992; Navy April 2006; Tetra Tech EM, Inc., 2013.

Key:

AOPI = area of potential interest
CERCLA = Comprehensive Environmental Response, Compensation and Liability Act
CLEAN = Comprehensive Long-Term Environmental Action Navy
DTSC = Department of Toxic Substances Control
ER = Environmental Restoration
IRP = Installation Restoration Program
NFA = no further action
RCRA = Resource Conservation and Recovery Act
RFI = RCRA Facility Investigation
RWQCB = Regional Water Quality Control Board
SI = site inspection or site investigation.
SWMU = solid waste management unit
TCE = trichloroethylene
UST = underground storage tank
VOC = volatile organic compound

Table E-2 Summary of Underground and Aboveground Storage Tanks

Location	Tank ID	Tank Capacity (Gallons)	Tank Contents	Date Removed	Current Status	Regulatory Determination
Building 79	UST 79	550	Diesel	11/8/90	CCHS NFA; no additional approvals necessary.	CCHS determination of NFA on 2/21/95.
Building 83	UST 83	6,500	Diesel	3/19/97	RWQCB NFA; no additional approvals necessary.	RWQCB determination of NFA on 10/4/06.

Appendix F

Solid Waste Supplemental Information

This appendix contains the assumptions, calculations, and supporting information for evaluating potential impacts on the environment from generating and managing C&D waste and non-C&D solid waste for Alternatives 1 and 2. For simplicity, it is assumed that the construction portion of the proposed action will be dominated by the generation and management of C&D waste, and the operational portion of the proposed action will be dominated by the generation and management of non-C&D waste.

Pertaining to Section **4.12, Other Utilities and Infrastructure, Solid Waste and Recycling Management**
Alternative 1 — Preferred Alternative

C&D Waste

Calculations of estimated C&D waste to be generated during demolition and construction activities of Alternative 1 are shown in Table F-1. Assume that 50% of the 123,000 tons generated by demolition activities and the 58,000 tons generated by construction activities would be diverted from landfilling in accordance with state law (California Integrated Waste Management Act of 1989 [AB 939]). Assume that on-site reuse of C&D waste on former NWS Concord property as hard fill or for other purposes is included in the 50% diversion.

> 0.5 x (123,000 tons + 58,000 tons) = 90,500 tons would require landfilling during buildout period

Demolition and construction likely will not be spread evenly throughout the buildout period and would tend to be concentrated in earlier years, when large portions of the former NWS Concord property would be demolished and cleared for redevelopment. Assume that, conservatively, 75% of the 90,500 tons would require landfilling in the first 10 years of the 25-year buildout period.

> 0.75 x 90,500 tons = 68,000 tons total would require landfilling in first 10 years of 25-year buildout period

Assuming 260 days of work per year in each year of the first 10 years:

> 68,000 tons ÷ 10 years ÷ 260 days/year = 26 tons/day C&D waste would require landfilling in the first 10 years of the 25-year buildout period

Assuming that 73% of the waste goes to Potrero Hills Landfill (PHL) and 27% to Keller Canyon Landfill (KCL), which are the percentages used by the City of Concord:

0.73 x 26 tons/day = 19 tons/day C&D waste would go to PHL during the first 10 years of the buildout period

0.27 x 26 tons/day = 7 tons/day C&D waste would go to KCL during the first 10 years of the buildout period

Non-C&D Waste

During operation of Alternative 1, the FEIR estimated that 49,884 tons per year of non-C&D solid waste would be generated (City of Concord 2010). Assume that means by the time of full buildout. Assuming the same 50% diversion rate, about 25,000 tons of non-C&D solid waste would be landfilled each year once full buildout has been achieved. Assume that, conservatively, non-C&D waste is generated at full buildout rates during the last 10 years of development of the 25-year buildout period.

25,000 tons/year ÷ 365 days/year = 68 tons/day non-C&D waste would require landfilling in the last 10 years of the 25-year buildout period

Assuming that 73% of the waste goes to PHL and 27% to KCL:

0.73 x 68 tons/day = 50 tons/day non-C&D waste would go to PHL during the last 10 years of the buildout period

0.27 x 68 tons/day = 18 tons/day non-C&D waste would go to KCL during the last 10 years of the buildout period

Solid Waste Disposal Relative to Landfill Permits and Quantities Typically Received by the Landfills

PHL is permitted for 3,400 tons per day (a maximum of 4,330 tons per day is allowed as long as an average of 3,400 tons per day averaged over a 7-day week is not exceeded) and KCL is permitted for 3,500 tons per day (Solano County Department of Resource Management 2012; Contra Costa Environmental Health 2009). In 2012, PHL received about 1,075 tons of waste per day (CalRecycle 2014c), and KCL received about 2,000 tons of waste per day (CalRecycle 2014d), well below what each landfill may accommodate by permit.

Assume that solid waste landfilling for the first 10 years of the 25-year buildout is dominated by C&D waste at 26 tons/day:

26 tons/day C&D waste to be landfilled ÷ 1,075 tons/day waste received by PHL (2012) x 100% = 2.4% increase

OR

26 tons/day C&D waste to be landfilled ÷ 2,000 tons/day waste received by KCL (2012) x 100% = 1.3% increase

Assume that solid waste landfilling for the last 10 years of the 25-year buildout is dominated by operational non-C&D waste at 68 tons/day:

68 tons/day non-C&D waste to be landfilled ÷ 1,075 tons/day waste received by PHL (2012) x 100% = 6.3% increase

OR

68 tons/day non-C&D waste to be landfilled ÷ 2,000 tons/day waste received by KCL (2012) x 100% = 3.4% increase

The above assumes that the relative waste quantities received by each landfill in 2012 will hold true throughout the buildout period.

Pertaining to Section **4.12, Other Utilities and Infrastructure, Solid Waste and Recycling Management**
Alternative 2 — Intensified Reuse

C&D Waste
Calculations of estimated C&D waste to be generated during demolition and construction activities of Alternative 2 are shown in Table F-1. General assumptions are the same as Alternative 1. Alternative 2 differs slightly from Alternative 1 in the estimates of C&D waste generated from construction, which is greater for the intensified reuse alternative.

0.5 x (123,000 tons + 71,000 tons) = 97,000 tons would require landfilling during buildout period

0.75 x 97,000 tons = 73,000 (rounded) tons total would require landfilling in first 10 years of 25-year buildout period

73,000 tons ÷ 10 years ÷ 260 days/year = 28 tons/day C&D waste would require landfilling in the first 10 years of the 25-year buildout period

0.73 x 28 tons/day = 20 tons/day C&D waste would go to PHL during the first 10 years of the buildout period

0.27 x 28 tons/day = 8 tons/day C&D waste would go to KCL during the first 10 years of the buildout period

Non-C&D Waste
Under Alternative 2, the additional residential population is estimated to be about 30% greater than under Alternative 1. Commercial contributions to non-C&D waste would remain unchanged. Accordingly, 56,000 tons per year were estimated to be generated. Assume that means by the time of full buildout. Assuming the same 50% diversion rate, about 28,000 tons of non-C&D solid waste would be landfilled each year once full

buildout has been achieved. Assume that, conservatively, non-C&D waste is generated at full buildout rates during the last 10 years of development of the 25-year buildout period.

28,000 tons/year ÷ 365 days/year = 77 tons/day non-C&D waste would require landfilling in the last 10 years of the 25-year buildout period

Assuming that 73% of the waste goes to PHL and 27% to KCL:

0.73 x 77 tons/day = 56 tons/day non-C&D waste would go to PHL during the last 10 years of the buildout period

0.27 x 77 tons/day = 21 tons/day non-C&D waste would go to KCL during the last 10 years of the buildout period

Solid Waste Disposal Relative to Landfill Permits and Quantities Typically Received by the Landfills

The permit requirements and 2012 disposal data for PHL and KCL are described under Alternative 1 — 1,075 tons/day received at PHL and 2,000 tons/day received at KCL in 2012, well below what each landfill can accommodate by permit.

Assume that solid waste landfilling for the first 10 years of the 25-year buildout is dominated by C&D waste at 28 tons/day:

28 tons/day C&D waste to be landfilled ÷ 1,075 tons/day waste received by PHL (2012) x 100% = 2.6% increase

OR

28 tons/day C&D waste to be landfilled ÷ 2,000 tons/day waste received by KCL (2012) x 100% = 1.4% increase

Assume that solid waste landfilling for the last 10 years of the 25-year buildout is dominated by operational solid waste at 77 tons/day:

77 tons/day solid waste to be landfilled ÷ 1,075 tons/day waste received by PHL (2012) x 100% = 7.2% increase

OR

77 tons/day solid waste to be landfilled ÷ 2,000 tons/day waste received by KCL (2012) x 100% = 3.9% increase

The above assumes that the relative waste quantities received by each landfill in 2012 will hold true throughout the buildout period.

Table F-1 C&D Waste Estimates

Demolition C&D Waste Estimates

Demolition C&D Waste Estimates -- Weapons magazines

Feature	Description	Material	Dimensions	Sq Ft	Other notes	calc'd vol of material of construction (cu yd)	Estimated volume of ACM (cu yd)	C&D Waste (cu yd)	C&D Waste (tons)
Site 22 magazine	weapons magazine	assume reinforced concrete; some steel	- 170 ft x 82 ft at bottom of trapezoid as measured with ArcMap tool. [Google map observation shows about 130 ft x 75 ft at bottom of trapezoid and 80 ft x 40 ft at top of trapezoid. ALH 2013 says 170 ft x 120 ft.]. Trapezoidal above surface; assume rectangular below surface. Due to discrepancies in dimensions and irregular shape, assume ave of 130 ft L x 60 ft W x 15 ft H if the bunker were a rectangle. -There are 118 magazines.	920,400	- Assume wall thickness of 0.5 feet (ALH 2013). - Assume height of 15 feet (unknown). - Internal walls and other components not known and not taken into account. - Aboveground divisions in bunkers not taken into account (some aboveground portions are not continuous). - Assume 25% load factor.	46,544		58,181	14,080
Site 22A magazine	weapons magazine	assume reinforced concrete; some steel	- 90 ft x 53 ft at bottom of a common magazine shape as measured with ArcMap tool. [Google map observation shows about 80 ft x 50 ft at bottom of shape, with a very narrow top to the trapezoid.] Trapezoidal above surface; assume rectangular below surface. Due to discrepancies in dimensions and irregular shape, assume ave of 70 ft L x 40 ft W x 15 ft H if the bunker were a rectangle. - There are 103 magazines.	288,400	- Not all magazines are the same dimensions across Site 22A. The larger, more-common magazine shape was used. - Assume wall thickness of 0.5 feet (ALH 2013). - Assume height of 15 feet (unknown). - Internal walls and other components not known and not taken into account. - Assume 25% load factor.	16,976		21,220	5,135

	Res – Moderate Density Townhomes	Unit (total of 2,060)	162 per unit of < 3 bedrooms	333,720	Based on apartments as there is no specific land use for townhomes; assumed that these units would be less than three bedrooms
DISTRICT TOTAL				1,248,312	
Commercial Flex	Commercial Office (Office Park/R&D)	730,000 sq ft	119 per 1,000 sq ft	86,870	
	Commercial Retail (Regional Retail)	850,000 sq ft	572 per 1,000 sq ft	486,200	
	Commercial Hotel (Business/Ltd Hotel)	Unit with restaurant (225 units or rooms)	119	26,775	Assumed with restaurant for most conservative estimate. First floor would also include lobby, restaurant, meeting rooms, etc., comprising a total of approximately 20,000 sq ft. Average hotel room size of 400 sq ft. Given that along with 100,000 sq ft in room space yields a total of 250 rooms total has been rounded down to 225 to account for some hallway space.
DISTRICT TOTAL				599,845	
Campus	Commercial Office (Campus Cluster)	800,000 sq ft	119 per 1,000 sq ft	95,200	
DISTRICT TOTAL				95,200	
First Responders Training Center	First Responder Training Center Facilities	N/A	N/A	N/A	Due to the composition off the training center as predominantly outdoor training areas, a park-like restroom has been assumed using the campground per space estimate. Assumed due to the space, that it is inclusive of at least 3 people for multiple uses per day. Therefore, one campground space equates to approximately 4 restroom stalls and sinks. Two spaces have been assumed for this use.
DISTRICT TOTAL				0	

Greenways, Citywide Parks, and Tournament Facilities	Citywide Park – Willow Pass Park Extension	Space (total of 4)	144	576	Based on campground - per space; assumed due to the space, it is inclusive of at least 3 people for multiple uses per day. Therefore, only one campground space for approx.. 4 restroom stalls and sinks. Size of this park is 45 acres so assumed a total of 2 restroom facilities for the park. Each facility would be comprised of the equivalent of 2 stalls for both men/women.
	Citywide Park – Tournament Facility	Space (total of 8)	144	1,152	Based on campground - per space due to lack of other similar land uses Nelson 2004. Assumed that one campground space is inclusive of at least 3 people for multiple uses per day. Therefore, one campground space can be assumed to be approx. 4 restroom stalls and sinks. For the tournament facility which is largely comprised of ball fields and similar, assumed a total of 8 spaces.
	Citywide Park – Ad to Tournament Facility	Space (total of 8)	144	1152	Based on campground - per space; assumed due to the space, it is inclusive of at least 3 people for multiple uses per day. Therefore, only one campground space for approx.. 4 restroom stalls and sinks. Size of this park is 100 acres so assumed a total of 4 restroom facilities for the park. Each facility would be comprised of the equivalent of 2 stalls for both men/women.
	Mt. Diablo Golf Course	Space (total of 2)	144	288	Based on campground - per space; assumed due to the space, it is inclusive of at least 3 people for multiple uses per day. Therefore, only one campground space for approx.. 4 restroom stalls and sinks. Assumed golf course club house would have the equivalent of two campground spaces.
	Central Greenway	N/A	N/A	--	
	Neighborhood Frame	N/A	N/A	--	
DISTRICT TOTAL				3,168	
Conservation Open Space	Mt. Diablo Creek Corridor	N/A	N/A	N/A	Assumed due to conservation open space that there would be no restrooms.
	Regional Park	N/A	N/A	N/A	Assumed due to conservation open space that there would be no restrooms.
				N/A	
TOTAL				5,496,717	0

Notes:

The estimates above have been based on guidance included in Nelson 2004. Land uses and associated wastewater flow estimates were taken from Table 8-2 Wastewater Treatment by Land Use.

Appendix G Record of Non-Applicability (RONA) for Clean Air Act (CAA) Conformity

This page intentionally left blank.

RECORD OF NON-APPLICABILITY (RONA) FOR CLEAN AIR ACT CONFORMITY FOR THE DISPOSAL AND REUSE OF THE NAVAL WEAPONS STATION SEAL BEACH DETACHMENT, CONCORD, CALIFORNIA

This Record of Non-Applicability (RONA) documents the Navy's determination that the requirement to make a Clean Air Act conformity determination does not apply to the proposed action.

BACKGROUND

The U.S. Environmental Protection Agency (EPA) published Determining Conformity of General Federal Actions to State or Federal Implementation Plans; Final Rule, in the November 30, 1993, *Federal Register* (40 CFR Parts 6, 51, and 93) and amended 40 CFR Parts 51 and 93 in 2010. The Navy published Clean Air Act Conformity Guidance in July 2013, which is referenced in OPNAVINST 5090.1D (Environmental Readiness Program) and the associated Manual (OPNAV M-5090.1). These publications provide implementing guidance to document Clean Air Act Conformity Determination requirements.

Federal regulations state that no department, agency, or instrumentality of the federal government shall engage in, support in any way, or provide financial assistance for, license or permit, or approve any activity that does not conform to an applicable implementation plan. It is the responsibility of the federal agency to determine whether a federal action conforms to the applicable implementation plan before the action is taken (40 CFR Part 93.150[b]). A federal action is exempt from the requirement to make a conformity determination if the action fits within one of the categories of actions identified at 40 CFR 93.153(c)(2) that have been deemed to result in no emissions increase or an increase in emissions that is clearly *de minimis*. The Navy's proposed action is to transfer former Naval Weapons Station (NWS) Concord lands to the City of Concord.

The requirement to prepare a conformity determination does not apply to a federal action if the action fits within one or more of the exemption categories at 40 CFR 93.153(c)(2). The proposed action fits within the exemption categories described below:

(xiv) Transfers of ownership, interests, and titles in land, facilities, and real and personal properties, regardless of the form or method of transfer

and

(xix) *Actions (or portions thereof) associated with transfers of land, facilities, title, and real properties through an enforceable contract or lease agreement where the delivery of the deed is required to occur promptly after a specific, reasonable condition is met, such as promptly after the land is certified as meeting the requirements of CERCLA, and where the Federal agency does not retain continuing authority to control emissions associated with the lands, facilities, title, or real properties.*

The Navy closed the former NWS Concord on September 30, 2008, in accordance with Public Law (P. L.) 101-510, the Defense Base Closure and Realignment Act of 1990, as amended in 2005 (DBCRA), and declared 5,028 acres of the Inland Area surplus to the needs of the federal government. In accordance with the DBCRA, the Navy is preparing for disposal or transfer of the surplus property from federal ownership.

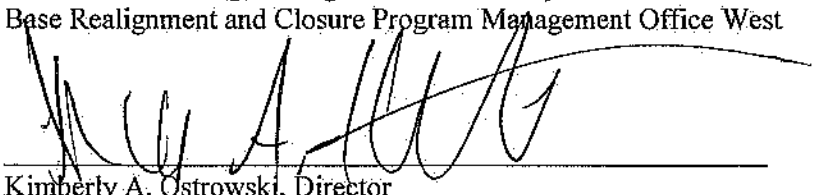
More generally, in the preamble to the General Conformity Rule, the EPA stated, "Under the exclusive definition of indirect emissions, Federal land transfers are unlikely to be covered since the Federal agency will not maintain authority over reuse activities on that land. Consequently, Federal land transfers are included in the regulatory list of actions that will not exceed the *de minimis* levels and are thus exempt from the conformity rules." 58 FR 63231 (1993). The proposed action fits squarely within the actions the EPA intended to exempt from the conformity requirement.

PROPOSED ACTION

Action Proponent: U.S. Department of Navy

Location: Former Naval Weapons Station, Seal Beach Detachment (NWS Concord), Concord, California

Proposed Action Name: Disposal and Reuse of the former NWS Concord, Concord, California



Proposed Action Description: The proposed action is disposal of surplus property at the former NWS Concord, and the subsequent redevelopment of the property by the local community. Reuse of the property would result in indirect air impacts from the construction and operation of the redevelopment plan; however, the Navy will not maintain authority over reuse activities.

Therefore, on the basis of the foregoing, the Navy concludes that the Clean Air Act Conformity Determination requirements do not apply to the proposed action, resulting in this Record of Non Applicability.

1 EXECUTIVE SUMMARY

This transportation impact study examines the current transportation network and addresses the environmental effects on the future circulation system from implementing the three alternatives of the proposed action (Action) for the former Naval Weapons Station Seal Beach Detachment (former NWS) Concord. The three alternatives are:

- No Action Alternative – Future conditions including projected population and employment growth as well as planned transportation system improvements contained in the latest Contra Costa Transportation Authority (CCTA) travel demand model for Year 2040. The NWS site would not be developed and activities on the NWS site would remain the same as Year 2013 when the counts were performed.

- Alternative 1: Concord Reuse Project Area Plan – Year 2040 conditions plus the addition of the land use and transportation network assumptions associated with Alternative 1, a mix of residential, commercial, institutional and community land uses as well as designated open space on the NWS site.
- Alternative 2: Intensified Reuse – Year 2040 conditions plus the addition of the land use and transportation network assumptions associated with Alternative 2, which contains the same external roadway connections and mix of land use types as Alternative 1 but with increased number of housing units on the NWS site.

The former NWS site is situated on approximately 5,038 acres in the northeast area of Concord, California. It is crossed by State Route 4 (SR 4), east of its interchanges with Interstate 680 (I-680) and State Route 242 (SR 242). Willow Pass Road and Bailey Road also cross the site in a northeasterly direction. The North Concord/Martinez station of the Bay Area Rapid Transit (BART) system is located immediate to the west off Port Chicago Highway. Current use on the abandoned site is limited to livestock grazing.

The effects on the circulation system from implementing the three alternatives were analyzed. The study locations include 28 intersections, five roadway segments, 12 freeway mainline segments, 21 freeway ramps, and four freeway corridors that are considered Routes of Regional Significance. These are locations that would be most likely to be affected by the implementation of the proposed Action.

The results of this study indicate that the proposed Action, under both Alternative 1 and Alternative 2, would contribute to future substandard conditions (i.e., operation below performance standards) at many study locations. Specific mitigation measures, including road-widening, that could address these impacts are presented in this study; however, it should be noted that the City of Concord's policy is to implement Transportation Demand Management (TDM) measures rather than roadway widening or other measures that would increase capacities, in support of regional, state, and national goals and policies addressing the reduction of greenhouse gas emissions through reduced automobile travel and increased transit, bicycle and walk trips. However, the effects of potential TDM measures are not assumed in this analysis, unless the TDM measure, such as enhanced bus service, is inherently captured

within the mode choice assumptions of the demand model. At this stage of planning for the reuse of the NWS site, specific development plans have not been proposed, and identifying and attempting to measure the effect of TDM measures on traffic and transportation impacts would be speculative. Therefore, mitigation in this study is presented for context, in order to illustrate the extent of each impact, rather than as measures that will be required by the City and implemented by specific developers of the NWS site. In addition, some of the mitigation measures presented in this study would be infeasible to implement due to physical limitations, as described below. Impacts on the Routes of Regional Significance (RRS) may be addressed in a regional manner through the Subregional Transportation Mitigation Fee program.

1.1 FINDINGS

1.1.1 No Action

- Nine intersections would operate below the performance thresholds during AM and/or PM peak hours under the No Action alternative.
- The Bailey Road segment east of Concord Boulevard would exceed performance thresholds during the AM peak hour.
- Four freeway mainline segments would exceed performance thresholds during the AM and/or PM peak hours:
    - Freeway mainline segments on westbound SR 4 between Bailey Road and SR 242 are projected to be over capacity in the AM peak hour; and
    - Freeway mainline segments on eastbound SR 4 between Port Chicago Highway and San Marco Boulevard would be over capacity in the PM peak hour.
- Eight freeway ramps serving westbound SR 4 would be below performance thresholds in the AM peak hour, while one ramp serving Interstate 680 and four ramps serving SR 4 would be below performance thresholds in the PM peak hour.
    - The heavy ramp volumes in the peak direction of SR 4 may be attributed to congestion on the freeway mainline segment, which would prompt some motorists to seek alternative routes.
- The delay index along the Central and East county corridors of Interstate 680, SR 4 and SR 242 and the HOV utilization on SR 4 in East county would also be within Multi-modal Transportation Service Objectives (MTSO) standards under the No Action alternative.

1.1.2 Alternative 1: Concord Reuse Project Area Plan

- Twelve intersections would not meet the performance thresholds during AM and/or PM peak hours under Alternative 1 including eight of the nine impacted intersections under the No Action alternative.

  - Mitigation was identified for seven intersections that would fully mitigate the impacts; however, implementation of the measures at two intersections may be infeasible due to physical constraints.
  - Mitigation was identified for the remaining five intersections that would lessen the impacts to better than or the same as the No Action alternative but the results would exceed the performance thresholds after implementation.

- The Port Chicago Highway roadway segment north of Olivera Road would degrade to below performance threshold during both peak hours and no feasible mitigation is identified.
- Four freeway mainline segments on SR 4 would exceed performance standards with Alternative 1 including the westbound segments from Bailey Road to SR 242 in the AM peak hour and the eastbound segments from Port Chicago Highway to Bailey Road in the PM peak hour. Two of these segments would be adversely affected and mitigation has been identified for these locations.
  - Of the four segments, the eastbound segment east of Port Chicago Highway and the two westbound segments between Willow Pass Road and SR 242 would have volume to capacity (v/c) ratios lower than those of the No Action alternative; therefore mitigation has not been identified at these two segments (H and I).
  - Widening SR 4 to increase capacity would improve the freeway mainline conditions to within performance threshold but such improvement has not been planned by the responsible agencies.
  - Ramp metering along the SR 4 and SR 242 corridors, which was implemented in September 2013, may improve freeway mainline operation but the effects are not assumed in the analysis.
- All 13 ramps that were projected to operate below performance standards under the No Action alternative would also be impacted with Alternative 1. Furthermore, three additional ramps along SR 4 would degrade to substandard conditions during the AM or PM peak hours.
  - At six of the impacted ramp locations, the v/c ratios are lower than those of the No Action alternative; therefore no mitigation has been identified.
  - A programmed interchange reconstruction project may improve ramp operations at the SR 4 westbound off-ramp to Willow Pass Road.
  - No improvement has been planned to address the regional corridor-related ramp operation issue.
- The delay indexes along the Central and East county freeway corridors of I-680, SR 4, and SR 242 and the HOV utilization on SR 4 in East county are projected to be within MTSO standards with Alternative 1.

1.1.3 Alternative 2: Intensified Reuse

- Thirteen intersections would operate below the performance thresholds during AM and/or PM peak hours under Alternative 2, all of which are also impacted under Alternative 1, except the Farm Bureau Road and Willow Pass Road intersection.
    -
    - Feasible mitigation was identified for eight intersections that would fully mitigate the impacts; however, implementation of mitigation at three of the locations may not be feasible due to physical constraints.
    - Mitigation was identified for the remaining five intersections that would lessen the impacts to better than or the same as the No Action alternative but the results would exceed the performance thresholds after implementation.
- As with Alternative 1, the Port Chicago Highway roadway segment north of Olivera Road would degrade to below performance threshold during both peak hours and no feasible mitigation is identified.
- All four freeway mainline segments that would exceed performance standards under Alternative 1 would also be impacted with Alternative 2. Three of the segments (I, J, and K) would be adversely affected.
    - Of the four impacted segments, the v/c ratio at the westbound segment east of SR 242 would be lower than that of the No Action alternative. Therefore no mitigation has been identified for SR 4 segment east of SR 242 (H).
    - Widening SR 4 to increase capacity would improve the conditions to within performance threshold but such improvement has not been planned.
    - Ramp metering along the SR 4 and SR 242 corridors, which was implemented in September 2013, may improve freeway mainline operations but the effects are not assumed in the analysis.
- Similar to Alternative 1, all 15 ramps along SR 4 as well as the Interstate 680 northbound off-ramp to Willow Pass Road would experience substandard conditions with Alternative 2.
    - The v/c ratio is the same or lower than that of the No Action alternative at four of the impacted freeway ramps (Willow Pass Road off ramp from northbound I-680 (#1), Port Chicago Hwy off-ramp from eastbound SR 4 (#7), Port Chicago Hwy off-ramp from westbound SR 4 (#11), and Willow Pass Rd on-ramp to westbound SR 4 (#12)therefore no mitigation has been identified.
    - A programmed interchange reconstruction project may improve ramp operations at the SR 4 westbound off-ramp to Willow Pass Road.
    - No improvement has been planned to address the regional corridor-related ramp operation issue.

- The delay indexes along the Central and East county freeway corridors of I-680, SR 4, and SR 242 and the HOV utilization on SR 4 in East county are projected to be within MTSO standards with Alternative 2.

2 INTRODUCTION

This transportation impact study examines the current transportation network and addresses the environmental effects on the future circulation system from implementing the proposed action (Action) for the former Naval Weapons Station Seal Beach Detachment (former NWS) Concord.

2.1 PROJECT UNDERSTANDING

The former NWS site is situated on approximately 5,038 acres in the northeast area of Concord, California. It is crossed by State Route 4 (SR 4), east of its interchanges with Interstate 680 (I-680) and State Route 242 (SR 242). Willow Pass Road and Bailey Road also cross the site in a northeasterly direction. The North Concord/Martinez station of the Bay Area Rapid Transit (BART) system is located immediately west of the site off Port Chicago Highway. Current use on the site is primarily limited to livestock grazing.

In 2007, the project area was designated as surplus property by the Navy; thereby initiating the process to prepare the site for closure and reuse as part of the Defense Base Closure and Realignment Act of 1990, as amended in 2005. This study assesses the potential transportation-related issues associated with two action alternatives identified for the reuse of the site as well as a "no action alternative." Alternative 1: Concord Reuse Project Area Plan is consistent with the 2012 Concord Reuse Project Area Plan prepared by the City of Concord. This alternative includes a mix of residential, commercial, institutional and community land uses as well as designated open space. Alternative 2: Intensified Reuse contains the same mix of uses, with increased number of housing units but the same amount of employment and college students. The two alternatives are graphically illustrated in Figure 1 and Figure 2. The No Action alternative assumes that no new actions would occur (i.e. the site would maintain at its current state).

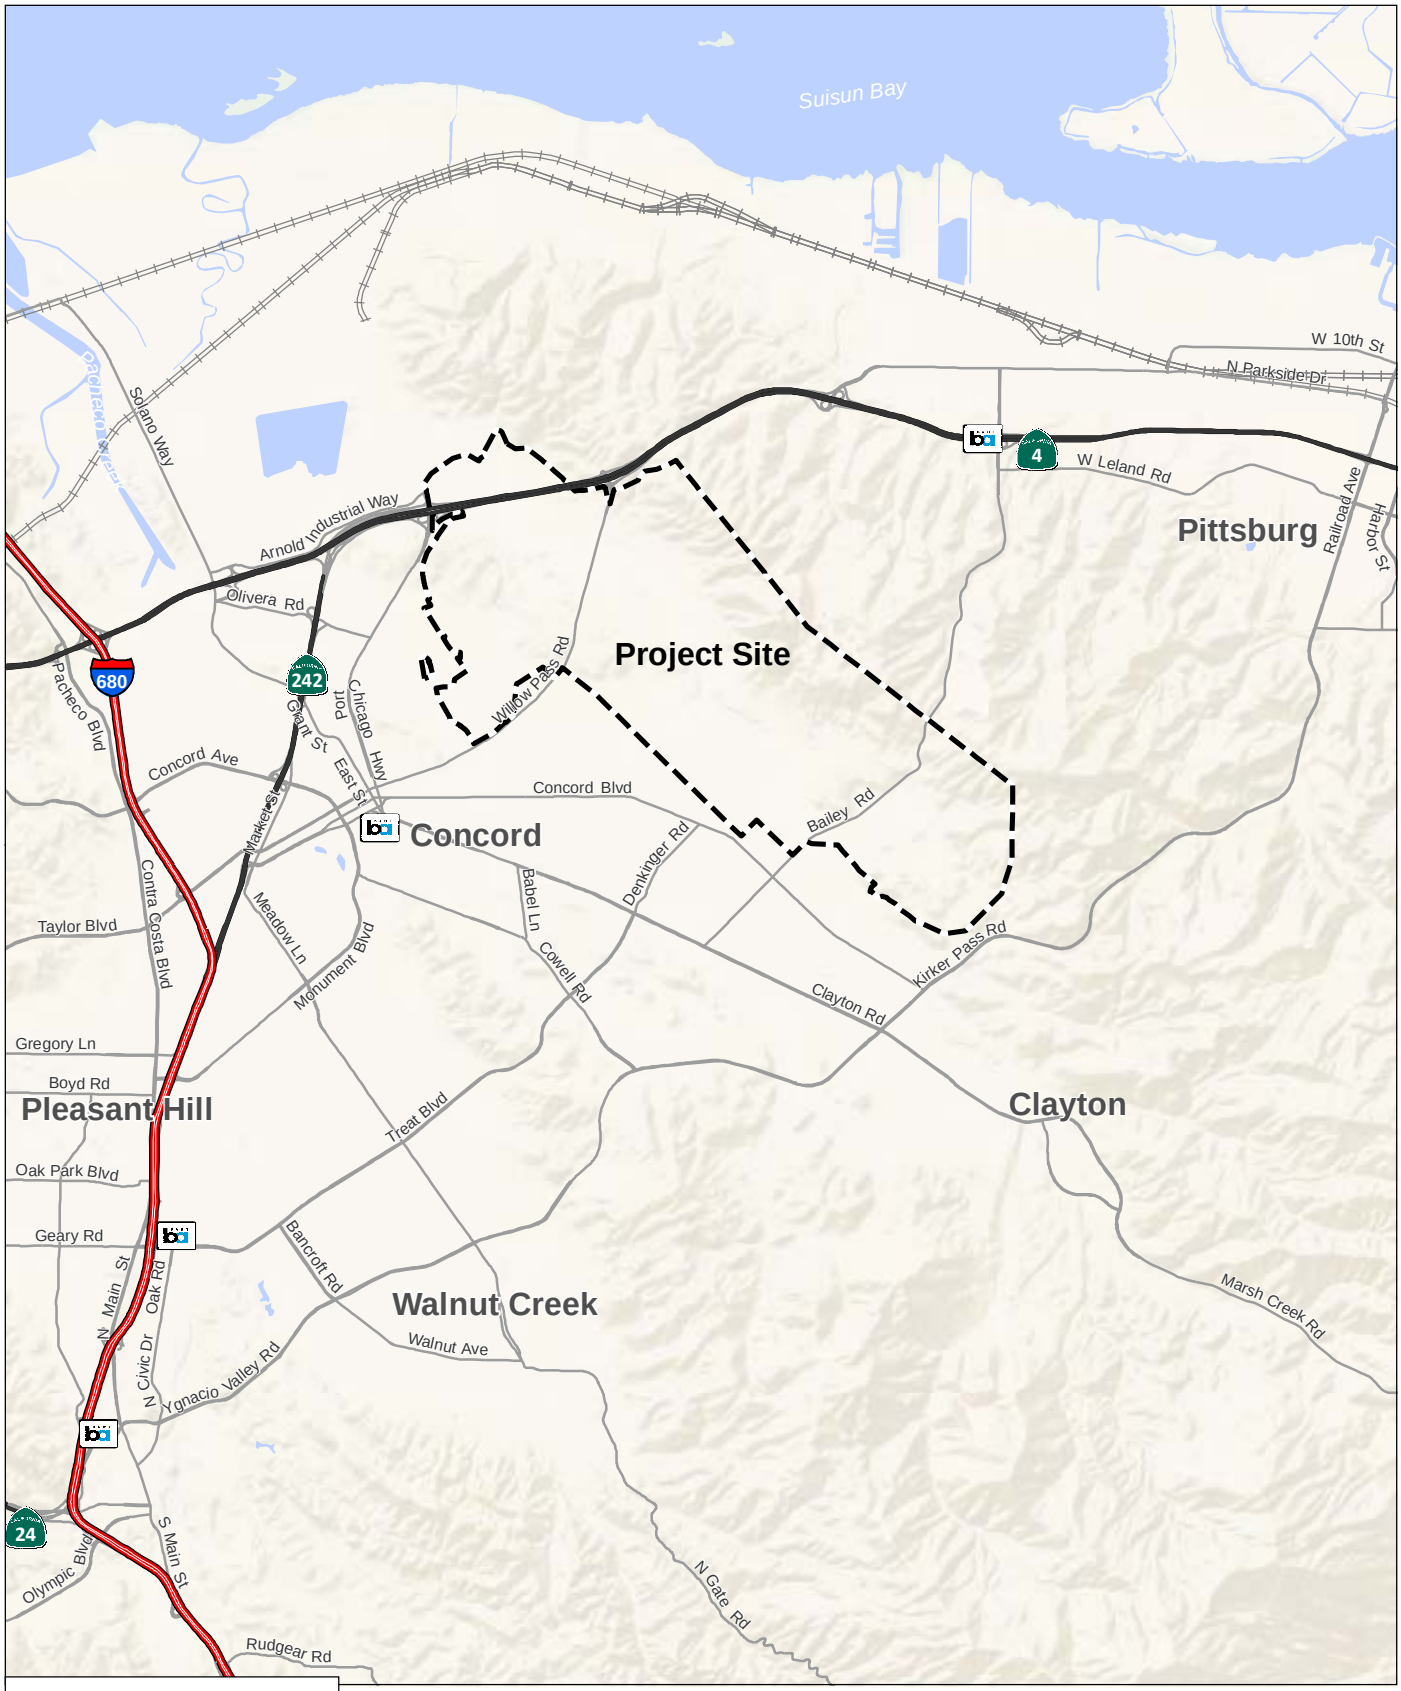
3 SETTING

The transportation-related context in the study area involves regional and local components of the roadway network as well as transit services and pedestrian and bicycle facilities.

3.1 ROADWAY NETWORK



The roadway network in the study area is comprised of the freeway system that serves Central and East Contra Costa County, which are two of the four sub-regions of Contra Costa County, and an extensive street system made up of arterial and local roads. Certain roadways, such as all freeways in the county and some arterial roads, have been designated as Routes of Regional Significance (RRS) in the respective sub-regional Action Plan for Routes of Regional Significance, recognizing their importance to the region's circulation network. The roadway network of the study area is graphically presented in Figure 3.

3.1.1 Freeways

State Route 4 (SR 4) is a major east-west route that spans from just west of Interstate 80 (I-80) in Hercules near the San Pablo Bay east to State Route 99 in Stockton in the Central Valley of California. In the study area, it runs through the NWS site in the northern region of Concord. SR 4 varies from a four-lane divided highway (east of I-680), to a six-lane highway (east of Arnold Industrial Way), to a nine-lane highway (east of Willow Pass Road), and then returns to a four-lane highway at Railroad Avenue in Pittsburg. The NWS site has access to SR 4 from Port Chicago Highway and Willow Pass Road.

Interstate 680 (I-680) is a major north-south freeway that spans across the Bay Area region north to I-80 in Fairfield and south to U.S. Highway 101 (US 101) in San Jose. In Concord, it runs along the west side of the city and intersects with SR 4 in unincorporated Contra Costa County. The number of lanes on I-680 in the study area varies from seven lanes north of SR 4 to 12 lanes north of Monument Boulevard.

State Route 242 (SR 242) is a main north-south route serving central Concord. The six-lane highway extends between I-680 to the southwest and SR 4 to the northwest of the NWS site. Direct ramp accesses are provided on Olivera Road, Concord Avenue and Clayton Road.

3.1.2 Key Roadways

Willow Pass Road is one of two existing roadways that cut across the NWS site. It consists of two distinct segments. The western segment spans between I-680 in Pleasant Hill and Evora Road just north of SR 4 in Concord, crossing through the NWS site. West of I-680, it continues as Sunvalley Boulevard. The eastern segment extends from SR 4 northeast to central Pittsburg, where it continues as W. 10th Street. South of SR 4, it is named San Marco Boulevard.

Bailey Road, the second of the two roadways that cut across the NWS site, extends from Willow Pass Road in Pittsburg, through the site, and terminates at Clayton Road in Concord. The portion of Bailey Road in Pittsburg is designated as a RRS.

Concord Boulevard stems from Clayton Road just east of SR 242 and continues eastward south of the southwest boundary of the NWS site to just past Kirker Pass Road, where it continues as Oakhurst Drive.

Port Chicago Highway is a semi-circular route that runs from Clayton Road in central Concord, north past the western boundary of the NWS site and SR 4, then eastward through unincorporated Contra Costa County to terminate at Willow Pass Road in Pittsburg.

Kirker Pass Road/Railroad Avenue/Ygnacio Valley Road is a major corridor extending between Pittsburg to the northeast and Walnut Creek to the southwest of the NWS site. The segment in Pittsburg is called Railroad Avenue. It becomes Kirker Pass Road as it traverses through unincorporated Contra Costa County and Concord southeast of the NWS site. South of Clayton Road in Concord, the name changes to Ygnacio Valley Road.

Treat Boulevard runs almost parallel with Ygnacio Valley Road from Clayton Road to North Main Street west of I-680 where it becomes Geary Road and continues through Pleasant Hill. North of Clayton Road, it becomes Denkinger Road and terminates at the site boundary. Treat Boulevard and Geary Road are designated as RRS.

3.2 STUDY LOCATIONS

A number of intersections, roadway segments, freeway mainline segments, and freeway ramps are selected for analysis in this study. The study locations were selected based on comments received during the scoping period for the Action and findings from previous studies performed by the City of Concord, specifically, the 2012 Concord Reuse Project Area Plan EIR Addendum (2012 Area Plan EIR Addendum), the 2010 Concord Community Reuse Project Final EIR (2010 Reuse Plan EIR), and the 2008 Concord Community Reuse Plan DEIR (2008 CCRP DEIR).

Locations analyzed in the 2010 Reuse Plan EIR served as the starting point of the study location selection process as the locations were well vetted through the City of Concord's public outreach

effort. The 2010 Reuse Plan EIR study locations were selected based on extensive feedback on the 2008 CCRP DEIR from the public and other agencies and jurisdictions. Locations analyzed in the 2008 CCRP DEIR were selected based on discussions with and review by the City Traffic Engineer, and included consideration of intersections at which 25 or more project trips would be added, regional routes to which 50 or more trips would be added, and freeways to which 50 or more project trips would be added, in accordance with CCTA and City guidelines.

Alternative 1 is based on the land use and roadway network assumed on the NWS site in the 2012 Area Plan EIR Addendum, which in turn represents a refinement of the land use and roadway network assumed for the Preferred Alternative in the 2010 Reuse Plan EIR. However, because the locations studied in the 2012 Area Plan EIR Addendum were a subset of those studied in the 2010 Reuse Plan EIR, the 2010 Reuse Plan EIR provided more locations to be considered as study locations for the proposed Action.

To narrow down the number of study locations from those in the 2010 Reuse Plan EIR to key locations for this study, the following three factors were taken into consideration:

- Locations that would operate below the level of service (LOS) thresholds[1] and worse than Existing Conditions under the Preferred Alternative in the 2010 Reuse Plan EIR
- Intersections that would operate within 0.05 volume-to-capacity ratio (v/c) of the LOS thresholds under the Preferred Alternative in the 2010 Reuse Plan EIR
- Intersections specifically mentioned in scoping comments for the proposed Action, such as a number of intersections along Concord Boulevard.

Each of these considerations is described in more detail as follows:

Locations that would operate below performance thresholds and worse than Existing Conditions are not necessarily locations identified to have significant impacts in the respective analyses. In some instances, the project would improve the level of service or would reduce the v/c as compared to future no project (no action) conditions. The proposed study locations include all locations that meet the above criteria in the 2010 Reuse Plan EIR, not only those that have been identified to have significant impacts.

Intersections that would operate within 0.05 v/c of the performance thresholds in the 2010 Reuse Plan EIR were also selected for inclusion in the analysis. While these locations were not shown to

[1] The 2010 Reuse Plan EIR established performance thresholds to determine whether the added project traffic would result in significant impacts. These findings from the 2010 Reuse Plan EIR were considered in the choice of study locations.

operate below standards, their v/c ratios were close enough to the thresholds so that they could potentially be exceeded under the proposed Action. Their inclusion provides a buffer to ensure locations that could potentially be adversely impacted were studied.

Finally, a number of intersections along Concord Boulevard were specifically identified as locations of concern through the scoping process for this Action. To ensure such concerns are addressed, those intersections are also included for analysis.

For freeway mainline segments, the selection considered the volumes on freeway mainline segments (ranging from 2,150 to almost 10,000 vehicles) and performance thresholds used to determine significance.. As previously stated, the 2008 CCRP DEIR and the 2010 Reuse Plan EIR freeway analysis segments were selected where 50 or more project trips were added. The selection of freeway mainline segments for this study was based on review of the analysis for the 19 freeway mainline segments from the 2010 Reuse Plan EIR and selection of locations that were impacted or were approaching the performance thresholds.

The selection of ramp locations for this study was based on a subset of the 40 ramps analyzed in the 2010 Reuse Plan EIR that were found to exceed performance thresholds. Low capacity facilities where performance thresholds were not exceeded in the 2010 Reuse Plan EIR were screened out through this selection process.

The selection process identified 28 intersections, five roadway segments, 12 freeway mainline segments and 21 freeway ramps for analysis. The study intersections and roadways are graphically shown in Figure 4 and the study freeway mainline segments and ramps in Figure 5.

A similar approach was used to select study locations on Routes of Regional Significance (RRS) based on the relevant performance metrics, specifically Multimodal Transportation Service Objectives (MTSO), as specified in the Action Plans for Routes of Regional Significance for central and east Contra Costa County, which are described in a latter section.. All 14 intersections on the RRS are part of the 28 intersections as denoted by "*" in the list below. The specific locations and extents of selected freeway segments for the RRS are dictated by the specific MTSO for that corridor.

3.3 EXISTING TRAFFIC VOLUMES

Existing traffic volumes for intersections, roadways, freeway mainline segments and ramps were collected or compiled from available sources in order to establish a basis for analysis in this study.

Intersection turning movement volumes at the study intersections were collected for the morning (AM) and afternoon (PM) peak commute periods in June 2013. These mid-week weekday volumes are intended to represent typical weekday traffic conditions. Seasonal and weekend traffic counts were not considered given the nature of the proposed uses and the programmatic nature of this analysis.[2] The AM peak commute period typically occurs between 7 AM and 9 AM and the PM peak commute period occurs between 4 PM and 6 PM. The counts were collected at 15-minute intervals during the two-hour peak period and were used to calculate the peak hour factor (PHF) for the analysis. The highest one-hour volumes during the peak morning and afternoon periods were identified for each study location and applied in the analysis. Intersection traffic count sheets are included in Appendix 6.

The overall volumes are lower by approximately 15 percent in the AM peak hour and approximately 9 percent in the PM peak hour than those used in the previous studies done by the City of Concord (as identified in the Study Locations section of this report above). The reduction could be attributed to several factors. The most significant influence is likely to be related to the economic conditions in recent years. Turning movement volumes for the previous studies were mostly collected in 2007 before the economy shifted downward the following year, which strongly affect Concord and Contra Costa County. As a result, business activities and corresponding traffic volumes declined. Even though the economy is recovering, the traffic volumes in 2013 had not yet returned to the peak 2007 levels.

The second factor that may contribute to the lower counts is that most private elementary and high schools in the study area had already recessed for summer vacation on the days of data collection. Further, the data were collected during the last week of public school in the Mount Diablo Unified School District, which serves Concord area. Both these factors would cause trip making patterns to change and affect the traffic volumes particularly in the AM peak period.

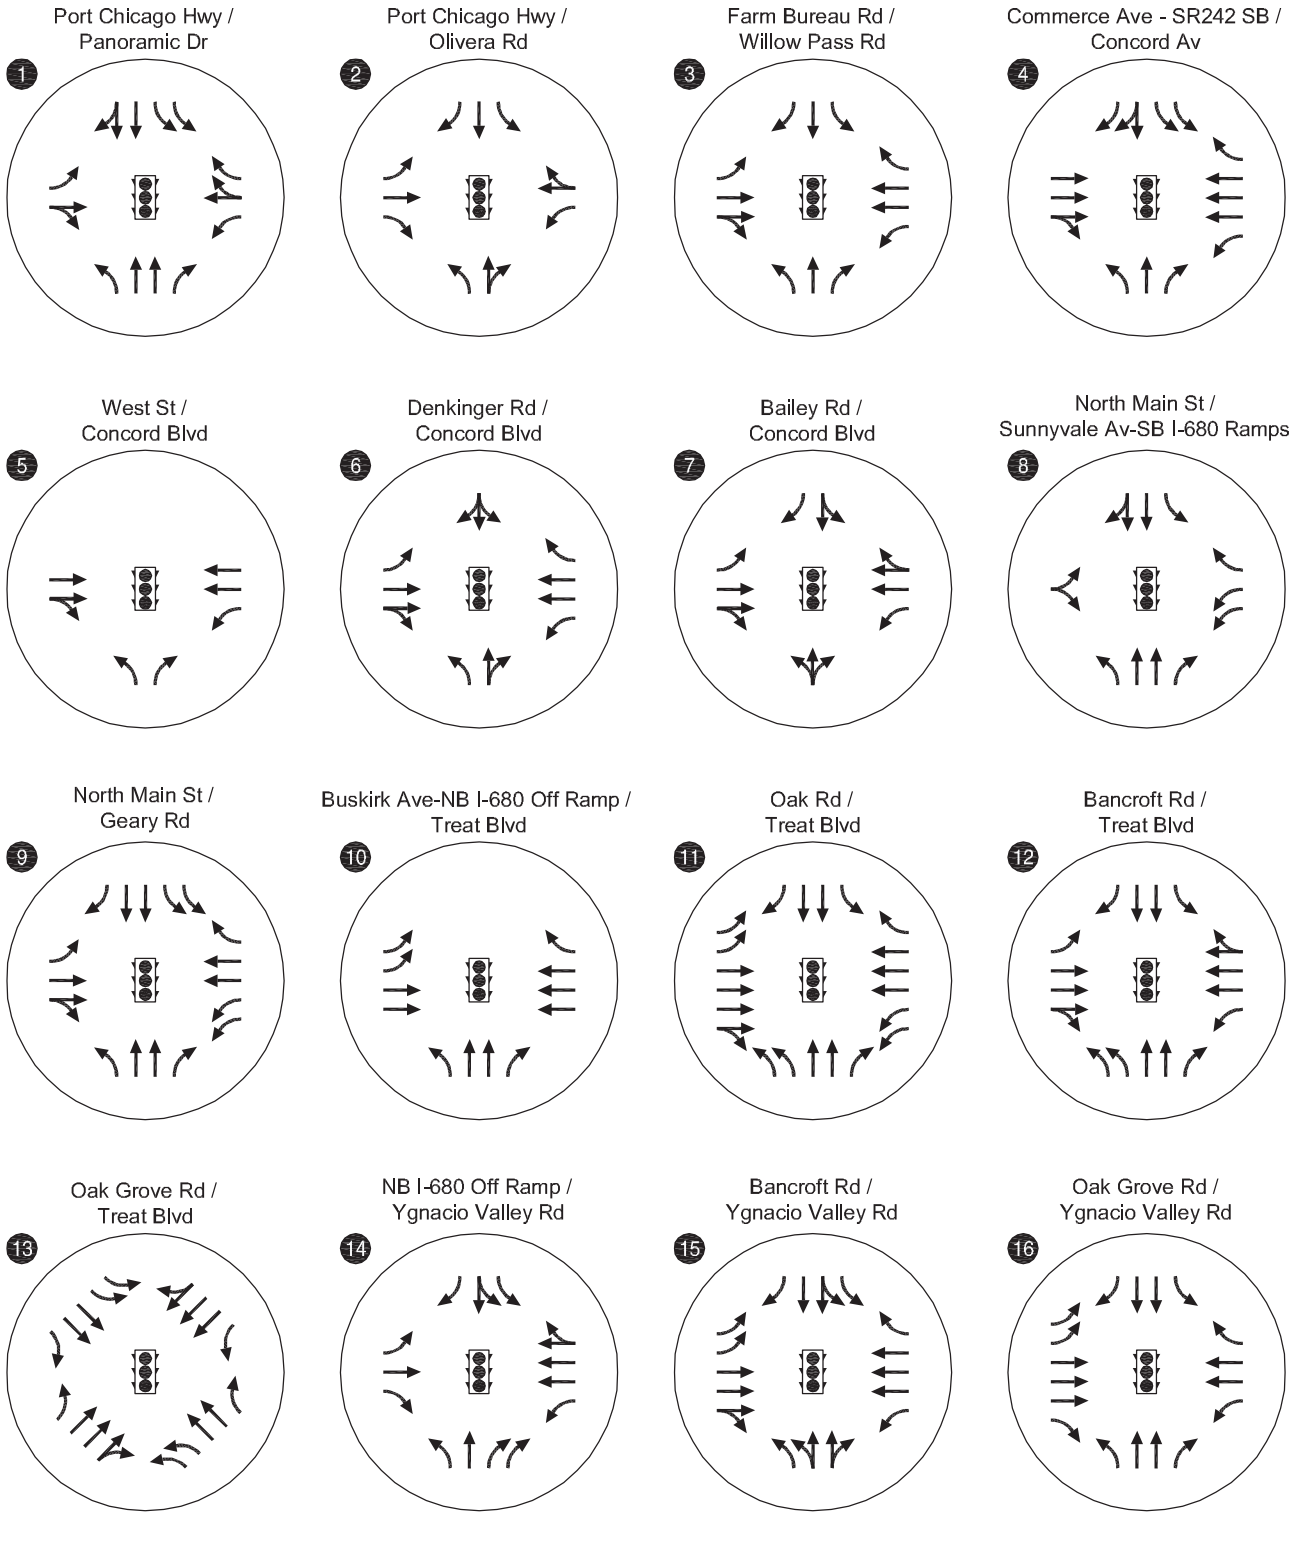
It is also noted that, due to equipment failure, counts for four of the intersections were collected on a later date in June after all schools were out on summer holiday or were compiled from data collected in 2010. The volumes at these four intersections were reviewed and adjustments were made as necessary based on approach and departure volumes at adjacent intersections to ensure reasonable traffic flow for consistency with the data at other analysis intersections. The existing geometries are shown in Figure 6 and peak hour volumes are shown in Figure 7.

[2] Weekend and seasonal traffic are typically considered at the project level analysis for uses that would typically generate higher traffic volumes on weekends and seasonally, such as shopping malls and tourist attractions.

Roadway segment volumes were derived from adjacent intersection turning movement volumes where applicable. Where intersection data are not adequate, machine counts on the roadway segments were collected in June 2013. Table 1 presents the existing two-way volumes on the study roadway segments.

Table 1 Roadway Segments – Existing Two-Way Peak Hour Volumes

	Link	Location	No. of Lanes	Volume	
				AM	PM
A	Ygnacio Valley Road	East of Cowell Rd	4	3,074	3,243
B	Bailey Road	East of Concord Blvd	2	924	700
C	Concord Blvd	West of Denkinger Rd	4	1,739	1,926
D	Port Chicago Hwy	North of Olivera Rd	2	1,009	1,223
E	Kirker Pass Road	South of Myrtle Dr	6	2,292	2,323



Source: Traffic Counts, 2013, see Appendix 6..

The peak hour freeway mainline segment and ramp traffic volumes were primarily compiled from a number of sources. First, ramp and mainline segment volumes on SR 4 and SR 242 were derived from data collected in February 2013 for the SR 4/SR 242 Ramp Metering Study (Kittelson & Associates 2013).[3] Traffic volumes for the I-680 corridor and other supplemental data were compiled from California Department of Transportation's (Caltrans) Performance Measurement System (PeMS)[4] and from Caltrans' most recently available (2012) estimate of average daily traffic for the freeway mainline and ramps.[5] The freeway mainline segment and ramp volumes are shown in Table 2 and Table 3, respectively.

[3] For the SR 4/SR 242 Ramp Metering Study, counts were collected every 15 minutes for the 3-hour peak period for 3 mid-week days in February 2013. In some cases where recent counts were not available, the volume was extrapolated from historical counts. Some of the mainline counts were actual counts, others are calculated.

[4] For I-680, PeMS data for several ramp and mainline location on I-680 were used to determine the peak hour percentage of average daily traffic by direction.

[5] For I-680 mainline segments, Caltrans 2012 Traffic Volumes (http://traffic-counts.dot.ca.gov/2012all/) provided the most recent average annual daily traffic (AADT) at the time of data collection. These 2012 traffic volumes are comparable to the 2013 volumes since Caltrans does not count each segment every year. In 2014, traffic volumes start to experience a slight increase on some segments of I-680. The peak month AADT was adjusted to peak hour, based on actual hourly counts at two locations from PeMS. For the I-680 ramps, 2012 Caltrans Ramp Volumes (http://traffic-counts.dot.ca.gov/docs/2012-ramp-vol-district04.pdf), were adjusted to peak hour using PeMs similar to the mainline volumes. A review of the ramp volumes indicates that 2012 represents the latest available count. When compared to 2009 volumes, the results vary with some increases, some decreases.

3.4 EXISTING OPERATIONS

Level of service (LOS) describes the operating conditions experienced by motorists. LOS is a qualitative measure of the effect of a number of factors, including speed and travel time, traffic interruptions, freedom to maneuver, driving comfort, and convenience. It is analogous to the letter grades in a school report card with LOS A through LOS F, which covers the entire range of traffic operations that might occur. Motorists using a facility that operates at LOS "A" experience very little delay, while those using a facility that operates at LOS "F" will experience intolerably long delays. These conditions are generally described in Table 4. The applicable LOS standards for this analysis are further detailed under the later "Performance Standards" section.

Table 4 General Level of Service Definitions

LOS	Description
A	**Free Flow or Insignificant Delays:** Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control delay at signalized intersections is minimal.
B	**Stable Operation or Minimal Delays:** The ability to maneuver within the traffic stream is only slightly restricted, and control delay at signalized intersections are not significant.
C	**Stable Operation or Acceptable Delays:** The ability to maneuver and change lanes is somewhat restricted, and average travel speeds may be about 50 percent of the free flow speed.
D	**Approaching Unstable or Tolerable Delays:** Small increases in flow may cause substantial increases in delay and decreases in travel speed.
E	**Unstable Operation or Significant Delays:** Significant delays may occur and average travel speeds may be 33 percent or less of the free flow speed.
F	**Forced Flow or Excessive Delays:** Congestion, high delays, and extensive queuing occur at critical signalized intersections with urban street flow at extremely low speeds.

Source: Highway Capacity Manual, Transportation Research Board, Washington D.C., 2010.

3.4.1 Intersections

Signalized intersections were analyzed using the procedures developed for the Contra Costa Transportation Authority (CCTA).[6] The CCTA LOS concept measures the amount of traffic that a roadway or intersection can accommodate, based on maneuverability, driver dissatisfaction, and delay. This metric is the volume to capacity (v/c) ratio. For unsignalized intersection analysis, the methodology outlined in the Transportation Research Board's Highway Capacity Manual (HCM) 2000 was applied. The metric used for the unsignalized intersection LOS was based on average vehicle delay. The LOS ranges for intersections are shown in Table 5.

[6] Contra Costa Transportation Authority, Technical Procedures Update, July 19, 2006.

Table 5 Intersection Level of Service Definitions

Level of Service	Signalized Intersection Volume-to-Capacity Ratio (v/c)	Unsignalized Intersection Average Vehicle Delay (seconds)
A	0.00 - 0.6	< 10
B	0.61 – 0.70	> 10 and < 15
C	0.71 – 0.80	> 15 and < 25
D	0.81 – 0.90	> 25 and < 35
E	0.91 – 1.00	> 35 and < 50
F	Varies[1]	> 50

Note:
[1] In general, volume-to-capacity ratios cannot be greater than 1.00, unless the lane capacity assumptions are too low. Also, if future demand projections are considered for analytical purposes, a ratio greater than 1.00 might be obtained, indicating that the projected demand would exceed the capacity.
Sources: Technical Procedures Update, Contra Costa Transportation Authority, July 19, 2006.

As the LOS results in Table 6 indicate, three analysis intersections currently operate below acceptable standards:

- Willow Pass Road & SR 4 westbound ramps (#19) – AM peak hour
- Willow Pass Road & SR 4 eastbound ramps (#20) - AM peak hour
- Bailey Road/ SR 4 EB ramps-BART access (#26) - PM peak hour

All three intersections are located at freeway access ramps. Caltrans' peak hour volume warrant is met at both all-way stop-controlled Willow Pass Road and SR 4 ramps intersections.

3.4.2 Roadway Segments

Level of service for roadway links was estimated using a planning methodology based on HCM 2010.[7] This methodology uses peak hour traffic volumes to determine LOS for general planning applications, as shown in Table 7. The capacity of a roadway is based on the number of signalized intersections per mile, number of lanes, presence of left-turn lanes and medians, and other factors from the HCM method. The volumes shown are the upper limit for that service level, therefore a peak hour volume greater than what is shown in LOS E would be LOS F. The existing levels of service for the analysis roadway segment locations are shown in Table 8. The levels of service of all analysis roadway segments are either LOS C or LOS D and fall within performance thresholds.

Volume shown is two-way volumes for the roadway segment; V/C denotes Volume-to-Capacity ratio ; LOS denotes Level of Service

3.4.3 Freeway Mainline Segments

Highway Capacity Manual 2010 procedures were used to calculate average daily capacities for each LOS threshold freeway mainline segments as consistent with guidelines established by the California Department of Transportation (Caltrans).[9] The level of service was determined using volume-to-capacity (v/c) ratio given an estimated free-flow speed of 70 mph for all the highway/freeway mainline segments. The v/c ratio is the ratio of flow rate to capacity for a transportation facility. Therefore, as the number of vehicles on a roadway increases to the point of maximum capacity of the roadway, the v/c ratio nears 1.0. Table 9 contains the v/c ratio thresholds for each level of service for freeway mainline segments. The existing level of service on the analysis mainline segments is shown in Table 10.

[9] California Department of Transportation, *Guide for the Preparation of Traffic Impact Studies*, December 2002.

n/o = north of; s/o = south of; e/o = east of; NB = northbound; SB = southbound; EB = eastbound; WB = westbound; v/c denotes volume-to-capacity ratio; LOS denotes level of service
The HCM basic freeway methodology does not apply to or take into account HOV lanes. Although a lower capacity may be appropriate for the HOV lane, the model forecasts assume the same capacity for the HOV lane and the mixed-flow lane, so no adjustment to the HOV lane capacity was applied.
Bold font denotes exceedance of performance thresholds.
Source: Kittelson & Associates, 2014.

With the exception of two westbound segments on SR 4, all analysis freeway mainline segments currently operate at LOS D or better. The SR 4 westbound freeway mainline segments to the east of the SR 242 junction and to the east of San Marco Boulevard operate at LOS F with v/c ratios exceeding 1.0 during the AM peak hour.

3.4.4 Freeway Ramps

For freeway ramps, HCM procedures, as specified by Caltrans, were used to calculate the density[10] for each LOS threshold. First calculated was the peak-hour demand flow rate immediately upstream of a merge influence area or at the beginning of the deceleration lane at the point of divergence. In addition, several capacity values were computed to determine the critical capacity. The determining capacities are: maximum total flow approaching a major diverge area on the freeway, maximum total vehicle flow departing from a merge or diverge area on the freeway, maximum total flow entering the ramp influence area, and maximum flow on a ramp. When demand flow is greater than the critical capacity, the LOS is F. Otherwise, given a length of the acceleration lane or deceleration lane, the LOS was determined using the density of flow within the ramp influence area according to HCM procedures. Table 11 presents the LOS and density thresholds for merge and diverge areas.

Table 11 Level of Service and Density Thresholds for Merge and Diverge Areas

Level of Service	Density (pc/mi/ln)
A	≤ 10
B	> 10-20
C	> 20-28
D	> 28-35
E	> 35
F	Demand exceeds capacity

pc/mi/ln = passenger car per mile per lane
Source: Highway Capacity Manual, Transportation Research Board, Washington, D.C., 2010.

The existing LOS on the analysis freeway ramp locations is shown in Table 12. The results indicate that ramps are currently operating at LOS E or F at three locations in the AM peak hour and two locations in the PM peak hour. The westbound off-ramps to Port Chicago Hwy and to Willow Pass Road from SR 4 and the westbound on-ramp from Willow Pass Road to SR 4 operate at LOS F during the AM peak hour. The eastbound off-ramp to San Marco Road from SR 4 also operates at LOS F during the PM peak hour, while the eastbound off-ramp to Willow Pass Road from SR 4 operates at LOS E during the PM peak hour.

[10] Density is the number of vehicles on a roadway segment averaged over space, usually expressed as vehicles per mile or vehicles per mile per lane.

3.4.5 Multimodal Transportation Service Objectives (MTSO)

Freeways and signalized intersections on Routes of Regional Significance are evaluated based on MTSOs established in the East County Action Plan for Routes of Regional Significance (August 2009) and the Central County Action Plan for Routes of Regional Significance (July 2009). MTSOs are measures of effectiveness selected by TRANSPAC and TRANSPLAN, the regional transportation planning committees for East and Central Counties.

The methodology used to evaluate signalized intersections on RRS is the same as that described in the previous section; however, the applicable MTSOs vary depending on locations. The MTSOs for the analysis intersections in Central County are based on LOS. The thresholds for the analysis intersections in East County are based on v/c. The LOS target for the analysis intersections is LOS F and the v/c targets for the analysis intersections in East County range from 0.85 to 0.99.

For the purposes of the MTSOs analysis, freeways are measured by delay index in both Central County and East County.[11] Delay index (DI) is used to measure travel congestion on a corridor. It compares the amount of time required to travel between two points during the peak hour and during non-congested, off-peak hours, which is assumed to be between 10:00 AM and 3:00 PM. For example, if the MTSOs set a target DI of 3 for the RRS, it means that the peak hour travel time is not more than three times the off-peak travel time. The DI targets for the analysis freeways range from 2.5 to 5. The target is meant to be applied to a corridor; while individual segments may violate the target DI.

Utilization of high occupancy vehicle (HOV) lanes is another MTSO for freeways in East County. HOV lane utilization should exceed 600 vehicles per lane in the peak direction at peak hour.

In this study, the MTSO analysis for intersections are incorporated in the "Intersection Analysis" section as the methodology for MTSO analysis is the same as other non-RRS intersections. The MTSO analysis refers only to the freeway analysis described above. The existing travel speed and delay index on the three analysis freeways are presented in Table 13 for Central County and in Table 14 for East County. The existing delay index along the Central and East county corridors would be less than 2.0, which meets the MTSO. HOV lane utilization for SR 4 in East County, shown in Table 15, exceeds 600 vehicles per lane in the peak direction during the peak hour.

3.5 TRANSIT

Contra Costa County has a well-developed transit system in the urbanized areas. The transit system in the study area includes rail and bus services provided by the Bay Area Rapid Transit system (BART), County Connection, and Tri-Delta Transit.

BART provides heavy rail service to San Francisco as well as Contra Costa, Alameda and San Mateo counties from three stations in the study area. The study area is served by the Millbrae/Pittsburg-Bay Point line via the following three stations:

- The Concord BART station is located on Oakland Avenue near the historic downtown.
- North Concord/Martinez BART station is located on Port Chicago Highway at the terminus of Panoramic Drive.
- The Pittsburg/Bay Point station, terminus of the Millbrae/Pittsburg-Bay Point line, is located on Bailey Road south of SR 4.

Park and Ride facilities, bicycle lockers, and County Connection and/or Tri-Delta Transit bus feeder services are provided at all three stations.

County Connection, operated by the Central Contra Costa Transit Authority (CCCTA), provides fixed route and paratransit bus service in Concord, Walnut Creek, Martinez, Lafayette, Orinda, Clayton,

Pleasant Hill, Moraga, Danville and San Ramon, as well as unincorporated communities in Central County. Concord is served by 12 County Connection fixed bus routes providing local and regional services. Currently, there are no routes through the NWS site.

Tri-Delta Transit, operated by Eastern Contra Costa Transit Authority, provides bus service in East Contra Costa County with 12 bus routes serving Concord, Pittsburg, and Bay Point. Transit service types provided are local, commuter, BART feeders, door-to-door paratransit services for senior citizens and people with disabilities, and shuttle services for community events.

3.6 PEDESTRIAN AND BICYCLE NETWORK

Bicycling and pedestrian facilities are important components of the transportation network in the study area. They not only offer non-vehicular opportunities for both commute and recreational trips but also provide connections to BART and bus stations to allow access to the regional transit network.

Bicycle routes and paths are typical examples of bicycle transportation facilities. Bicycle facilities are defined as the following three classes according to Chapter 1000 of the Caltrans Highway Design Manual:

> **Class I** - Provides a completely separated facility designed for the exclusive use of bicyclists and pedestrians with crossing points minimized.
>
> **Class II** – Provides a restricted right-of-way designated lane for the exclusive or semi-exclusive use of bicycles with through travel by motor vehicles or pedestrians prohibited, but with vehicle parking and cross-flows by pedestrians and motorists permitted.
>
> **Class III** – Provides a right-of-way designated by signs or permanent markings and shared with pedestrians and motorists.

The Contra Costa Countywide Bike and Pedestrian Plan, adopted in 2009, provides policy and infrastructure recommendations to improve bicycle and pedestrian facilities throughout the region. The Plan identified an extensive network of bicycle facilities in the study area and several existing and proposed Class I trails and one proposed Class II bike lane through the NWS site. The Plan also recommends that pedestrian improvements be prioritized in the following three areas: pedestrian-oriented districts, routes to transit and routes to other key activity centers.

Sidewalks provide access and circulation in key pedestrian activity areas. The City of Concord typically requires the installation of sidewalks for any new development. The Concord Trails Master Plan, which was adopted in 2002, provides a framework for planning trails in Concord with the purpose of promoting the use of trails for recreation as well as an alternative mode of transportation. Within the site, the Plan identifies several potential trail routes, including a connection to the Delta De Anza Trail and Class I collector trails that follow either rail lines or creeks that run through the site.

4 TRANSPORTATION IMPACT ANALYSIS

Analyses were performed for future cumulative conditions to determine the effect of the proposed action in combination with the projected growth in the surrounding communities. The cumulative analysis scenarios are summarized below and further detailed in the following section:

- No Action Alternative – Future conditions include projected population and employment growth as well as planned transportation system improvements contained in the latest CCTA travel demand model for Year 2040. The NWS site would not be developed and activities on the NWS site remain the same as Year 2013 when the counts were performed.

- Alternative 1: Concord Reuse Project Area Plan – Year 2040 conditions plus the addition of the land use and transportation network assumptions associated with Alternative 1 on the NWS site.
- Alternative 2: Intensified Reuse – Year 2040 conditions plus the addition of the land use and transportation network assumptions associated with Alternative 2 on the NWS site.

4.1 MODEL FORECASTS

The latest countywide travel demand model of the Contra Costa Transportation Authority (CCTA) was used to develop future volume forecasts for cumulative conditions. The county is divided into traffic analysis zones (TAZs) in the model. The TAZs used for all study scenarios in this analysis, including No Action, Alternative 1 and Alternative 2, are the same as the ones used for the 2010 Reuse Plan EIR and the 2012 Area Plan EIR Addendum. Therefore, the analysis also realized the benefits of smaller dense zones around the North Concord/Martinez BART Station that help capture trip distribution that are more sensitive to transit-oriented development and pedestrian-oriented landscape.

The model includes future development throughout the region. The 2040 cumulative land use and socioeconomic forecasts are consistent with regional totals for growth projected in the Sustainable Communities Strategy Base Case "Modified Projections 2009" land use unofficially released by the Association of Bay Area Governments (ABAG). Therefore, the traffic forecasts reflect traffic from growth in Concord, as well as traffic in the region that may use the local roadways.

The CCTA model includes roadway improvements that have been planned or programmed for Concord and neighboring communities. For the network within Concord, the CCTA model was modified to reflect planned improvements that are not included in the model but are a part of the Concord General Plan and/or the City's Capital Improvement Program. These improvements are assumed to be in place under all cumulative alternatives:

1. I-680/Marina Vista Interchange Modifications
2. Bates Avenue: Widen to four lanes from Industrial Way to Mason Circle
3. Port Chicago Highway: Widen to four lanes from Bates Avenue north to the Union Pacific Railroad (UPRR) crossing

4. Evora Road: Widen from Willow Pass to Pomo Street
5. West Leland Road Extension and Avila Road Widening
6. Pacheco Boulevard: Widen to four lanes north of SR 4
7. SR 4 and I-680 connector ramps and high-occupancy vehicle (HOV) connection
8. Marsh Drive: Widen to four lanes from Center Avenue to Concord city limit
9. Willow Pass Road: Widen to four lanes between Landana Drive and SR 4
10. Commerce Avenue Extension: Extend existing two-lane arterial
11. Waterworld Parkway Bridge over Walnut Creek: Construct a two-lane bridge with bicycle lanes over Walnut Creek connecting Waterworld Parkway with Meridian Park Boulevard
12. Clayton Road/SR 242 Interchange: New northbound on-ramp and new southbound off-ramp
13. Meadow Lane: Widen to four lanes between Monument Boulevard and Clayton Road
14. Monument Boulevard: Widen to six lanes from Systron Drive to Cowell Road
15. Concord Boulevard: Widen to four lanes from 6th Street to Farm Bureau Road
16. Farm Bureau Road: Widen to four lanes between Willow Pass Road and Clayton Road
17. Denkinger Road: Widen to four lanes between Clayton Road and Concord Boulevard
18. Cowell Road: Widen to four lanes between Monument Boulevard and Treat Boulevard
19. I-680 northbound HOV lane from North Main Street to SR 242 and I-680 southbound HOV lane from North Main Street to Livorna Road
20. Ygnacio Valley Road: Widen to six lanes between Cowell Road and Michigan Boulevard
21. Kirker Pass Road: Add climbing lane from Clearbrook Drive to Pittsburg city limit
22. Buchanan Road Bypass: Connect James Donlon Boulevard to Kirker Pass Road
23. SR 4 widening to provide an additional lane eastbound and westbound between SR 242 and I-680

For the three analysis alternatives, the model databanks, including land use, socioeconomic input as well as roadway and transit networks for the site, were modified to reflect the analysis scenarios. The proposed roadway networks for Alternative 1 and Alternative 2 are shown in Figure 1 and Figure 2. The land use and roadway and transit networks of Alternative 1 are the same as those assumed in the 2012 Area Plan EIR Addendum; the roadway and transit networks of Alternative 2 are similar to Alternative 1. As the program for the site is developed, the on-site roadway and transit networks would be refined. The roadway networks on Figure 1 and Figure 2 are based on existing knowledge and likely development of the site; as specific development proposals are made, the on-site roadway network may be modified. However, the planned connections to existing roadways outside the project site would not be altered.

The CCTA model follows a four-step process to estimate travel behavior and travel demand for the proposed reuse of NWS Concord in the context of the surrounding land uses and transportation systems. The process includes the following four steps:

1. Trip generation to estimate the number of trips that will be made.
2. Trip distribution to estimate where those trips will go.
3. Mode choice to estimate how the trips will be divided among the modes of travel; and
4. Trip assignment to predict the routes those trips will take.

The trip generation emulates the regional Metropolitan Transportation Commission (MTC) *person* trip generation, which includes non-motorized (bicycle and walk) trips as well as motorized modes (auto and transit). The trip generation is based on inputs, such as population, households, employed residents, employment by category (service, retail, agricultural, industrial, and other), income classifications, school enrollment, and age categories as well as other characteristics of the traffic analysis zone (TAZ), like parking costs and terminal times. The motorized trips are distributed between 'productions' (trips made by households, workers, or students from the home end) and 'attractions' (non-home end) and assigned to the roadway and transit networks.

With this latest version of the CCTA model, almost 300 smaller TAZs were added in the vicinity of the transit-oriented developments (TODs) and Priority Development Areas (PDAs) throughout Contra Costa County to better reflect the trip-making associated with smart growth. These smaller TAZs and more detailed roadway networks serve to represent good access to transit and shorter trips associated with walking and/or bicycling. The detailed geographic representations of TODs and PDAs enable the model to capture many of the "4Ds" effects. The 4Ds: density, diversity, design and destinations, are characteristics of the built environment that tend to affect travel behavior. The small TAZs represent shorter walk distances within zones (density) and shorter distances between mixed uses within a zone (diversity). Further, the detailed network represents shorter distances between zones (destinations). The latest CCTA model includes transit and auto accessibility factors as zonal inputs which affect auto ownership and make the model more responsive to TOD characteristics. These accessibility factors affect project vehicle trip generation and vehicle miles travelled, when compared with the previous model. For this analysis, the smaller TAZs and more detailed roadway network can be found around the North Concord/Martinez BART station, as shown in Figure 8.

Table 16 provides a summary of daily vehicle trips, average vehicle trip lengths, and vehicle miles traveled (VMT) from the CCTA model runs. The City of Concord provided household population, employment, and student enrollment numbers by TAZ to generate the number of daily vehicle trips, average vehicle trip lengths, and VMTs. The daily vehicle trips are trips that are generated on the site and include trips with one or both of the trip's ends on the site. VMT represents the total travel on the roadway network by all vehicle trips with one or both ends on the site including the travel to and from the site that is generated by those trips. This measure does not include regional trips that would pass through the site or Concord but do not have a trip end on the site.

The trip summaries indicate that while Alternative 2 has 23 percent greater population than Alternative 1, the number of employment and college students are the same between the two alternatives. Consequently, Alternative 2 would generate almost 13 percent more daily vehicle trips and 17 percent more VMT than Alternative 1. The average trip length for Alternative 2 is also slightly longer than that of Alternative 1. The average trip length is calculated by dividing VMT by the number of vehicle trips.

Estimates of the vehicle trips that would be generated throughout the NWS site are based on the location of the proposed development and the type of uses being proposed. Details of daily vehicle trips by TAZ are provided in Table 17. The area close to the BART station with highest employment (TAZ 20636) generates the most daily vehicle trips in Alternative 1 and Alternative 2.

Source: Kittelson & Associate, 2014.

The second step in the model was to estimate trip distribution or the number of trips between each zone of origin and destination. The CCTA model accomplishes this through a gravity model that uses travel time between TAZs and trip purpose (e.g., work, shopping, school) to estimate where trips will go. Table 18 shows where vehicle trips would go during the AM and PM peak hours, which are the time periods for which the analyses were conducted. As shown in Table 18, the travel patterns for both alternatives are similar, with most (almost half) of the vehicle trips going to and coming from the east (East Contra Costa County). The vehicle trips that would stay internal to the NWS site (shown in the table as Project Area trips) represent 15 to 16 percent of all trips for Alternatives 1 and 2 during the AM peak hour and 19 percent of all trips for both alternatives during the PM peak hour.

The third step in the model is to determine what mode of travel is used. The CCTA model estimates the mode of travel through a series of choices that capture decisions made by the traveler. Generally, the first choice is whether to travel by vehicle (e.g. automobile or transit) or non-vehicle (walk or bike), then the second choice, where relevant, breaks those choices down further into more specific automobile travel decisions (e.g. drive alone or carpool) and mode of travel to the transit (e.g. by walking or driving to the station or bus stop). As shown in Table 19, the CCTA model estimates that the mode of travel for the NWS project is primarily automobile trips. While the area near the BART station is designed as a transit-oriented development (TOD), the CCTA model shows that the project would result in relatively low transit use, which could be attributed in part to the fact that most of the development of the NWS site, including the college, is outside the TOD. However, it should be noted that the mode choice estimates from this version of the CCTA model (as compared to the previous version, which applied manual overrides to compensate for prior limitations of the model that was used to support the traffic analysis in the EIR and EIR Addendum), applies zonal accessibility assumptions that are consistent with the regional (MTC) model, resulting in vehicle trips rather than transit trips for a more conservative estimate of the traffic impacts discussed below.

Table 19 includes an estimate of the mode of travel for trips that would be internal to the NWS site (from NWS to NWS). While a smaller portion of overall trips for each alternative (about 3 percent), walk trips represent about 13 percent of the trips that would occur within the project site for both alternatives. Transit travel for trips that are coming from NWS and going to outside the project site would be higher than those trips coming from outside and going to the NWS site.

Source: Kittelson & Associates, Inc., 2014.

Note: "Transit" includes two categories, "transit-walk," which refers to trips for which the transit rider walks to the transit stop/station, and "transit-drive," which refers to trips for which the transit rider drives to the transit stop/station.

The last step of the model is trip assignment, where vehicle trips are allocated to specific routes on the roadway network between TAZs representing the origins and destinations based on the trip distribution described above. The model determines the specific route based on the peak hour travel times between zonal pairs that are reflective of the traffic volumes on the roadways. The trip assignment would reflect slower speeds, thus increased travel times, as traffic volumes increase on a particular roadway.

4.2 PERFORMANCE STANDARDS

The performance standards for study roadway facilities are governed by a number of programs and plans put forth by CCTA and its regional planning committees, the California Department of Transportation (Caltrans), and the City of Concord. These programs and plans include 1) the Congestion Management Program (CMP), in which CCTA established standards for freeway mainline segments and certain intersections on the CMP network; [12] 2) Action Plans for Routes of Regional Significance, in which TRANSPAC and TRANSPLAN, sub-regional transportation planning committees for the Central County and East County, respectively, established multi-modal transportation service objectives (MTSOs) for certain roadways and intersections on designated Routes of Regional Significance (RRS) within their respective subareas; and 3) the City of Concord General Plan Policies, which established two distinct LOS standards for applications on basic roadway segments and intersections located within Concord's Central Business District, North Concord/Martinez BART station area, and on transit routes and those located outside of these areas. When multiple standards are applicable, the most stringent standards are applied. The standards relevant to the study locations are provided below.

Contra Costa Congestion Management Program

The CMP has identified performance standards to be LOS F along the following freeway mainline segments:

- Southbound Interstate 680
- Northbound Interstate 680 north of SR 4
- Northbound Interstate 680 between SR 242 and El Cerro Boulevard
- Southbound SR 242
- SR 4 east of SR 242 (both directions)

The CMP has identified performance standards to be LOS E along the following freeway mainline segments:

- Northbound Interstate 680 between SR 4 and SR 242
- SR 4, Interstate 680 and SR 242 (both directions)

[12] Contra Costa Transportation Authority, *2011 Update Contra Costa Congestion Management Program* (adopted November 16, 2011).

- Northbound SR 242

The CMP has identified performance standards to be LOS F at the following intersections:

- North Main Street and Sunnyvale Avenue/I-680 ramps (#8)
- North Main Street and Geary Road (#9)
- Bancroft Road and Treat Boulevard (#12)
- Oak Grove Road and Treat Boulevard (#13)
- Walnut Avenue-Bancroft Road and Ygnacio Valley Road (#15)
- Oak Grove Road and Ygnacio Valley Road (#16)
- Ayers Road and Ygnacio Valley Road (#17)

The CMP has identified performance standards to be LOS E at the following intersections:

- Buskirk Avenue-NB Interstate 680 off ramp and Treat Boulevard (#10)
- Oak Road and Treat Boulevard (#11)
- Northbound Interstate 680 off ramp and Ygnacio Valley Road (#14)

Central County and East County Action Plans for Routes of Regional Significance

The following MTSOs for freeway Routes of Regional Significance have been adopted:

- Interstate 680 – 4.0 delay index
- SR 242 – 3.0 delay index
- SR 4 – 5.0 delay index from Cummings Skyway to Willow Pass Road
- SR 4 – 2.5 delay index in East County
- SR 4 – 600 vehicle per HOV lane utilization in the peak direction at peak hour in East County

The following MTSO for arterial Routes of Regional Significance have been adopted:

- North Main Street and Geary Road intersection (#9) – LOS F
- Bancroft Road and Treat Boulevard intersection (#12) – LOS F
- Walnut Avenue-Bancroft Road and Ygnacio Valley Road intersection (#15) – LOS F
- Willow Pass Road and Evora Road (west) intersection (#18) – LOS mid-D (v/c 0.85)
- Willow Pass Road and SR 4 westbound ramps intersection (#19) - LOS mid-D (v/c 0.85)
- Willow Pass Road and SR 4 eastbound ramps intersection (#20) - LOS mid-D (v/c 0.85)
- Willow Pass Road and Avila Road intersection (#21) - LOS mid-D (v/c 0.85)
- Willow Pass Road and Evora Road (East)-SR 4 westbound off-ramp intersection (#22) – LOS mid-D (v/c 0.85)
- San Marco Boulevard-Willow Pass Road /SR 4 eastbound ramps intersection (#23) – LOS mid-D (v/c 0.85)
- San Marco Boulevard and W. Leland Road intersection (#24) – LOS mid-D (v/c 0.85)
- Bailey Road and Willow Pass Road intersection (#25) – LOS E
- Bailey Road and SR 4 eastbound ramps-BART access intersection (#26) – LOS E
- Railroad Avenue and W. Leland Road intersection (#27) – LOS mid-D (v/c 0.85)
- Kirker Pass Road and James Donlon Boulevard intersection (#28) – LOS mid-D (v/c 0.85)

City of Concord General Plan

The City of Concord General Plan has established the following performance benchmarks for signalized intersections and roadway segments:

- Outside the Central Business District[13], outside ½ mile of BART, and not on transit routes[14] - LOS D (0.90 v/c)
- Central Business District, within ½ mile of a BART Station, or on transit routes - LOS E (Up to 1.0 v/c)
- Congestion Management Plan (CMP) Monitoring Intersections operating at LOS F in 1991 and roadway segments connecting to one or more such intersections - LOS F (over 1.0 v/c)
- All remaining CMP Monitoring Intersections and roadway segments[15] connecting to one or more of such intersections - LOS E (Up to 1.0 v/c)
- For transportation facilities that fail to meet LOS standards (as defined above) under no project conditions, an increase in the volume/capacity ratio of 0.03 or greater above no project conditions was considered to be significant.

4.3 IMPACT ANALYSIS

The potential effects of the no action alternative and the action alternatives (Alternative 1 and Alternative 2) on the study intersections, roadway segments, freeway mainline segments and ramps were assessed. The analysis results for the study intersections (Table 20), roadway segments (Table 21), freeway mainline segments (Table 22 and Table 23), freeway ramps (Table 24 and Table 25), freeway segment delay index (Table 26 and Table 27), and HOV lane utilization (Table 28) are presented in this section.

A summary of the number of impacted locations is presented in Table 29. Figures showing the location of these impacts are provided in Appendix 5. An impacted location is where 1) the condition would fall below the performance thresholds if the location is within standard under Existing Conditions; or 2) the v/c ratio is higher than that of Existing Conditions if the threshold is already exceeded under Existing Conditions.

[13] The Central Business District is generally defined as the area bound by Concord Avenue and Salvio Street to the north, Willow Pass Road, Clayton Road and Galindo Street to the south; Port Chicago Highway, Oakland Avenue and Mesa Street to the east; and I-680 to the west.

[14] Transit routes are generally defined as serving two or more transit lines

[15] LOS F if roadway segment is located between LOS E and LOS F Monitoring Intersections.

V/C denotes Volume-to-Capacity ratio and is used for signalized intersections; average vehicle delay in seconds are used for unsignalized intersections; all future intersections are signalized;
Analysis performed with CCTALOS methodology using Traffix software program
Bold font denotes exceedance of performance thresholds
Green highlight denotes a project-specific impacted location under either action alternative where the v/c or delay is lower than or same as No Action alternative
Yellow highlight denotes a project-specific impacted location under either action alternative where the v/c or delay is higher than No Action alternative
Purple highlight denotes a contributing impacted location under either action alternative where the v/c or delay is higher than No Action alternative and already exceeds LOS threshold under Existing Conditions

Dir denotes Direction; LOS denotes level of service; v/c denotes volume-to-capacity ratio
Bold font denotes exceedance of performance thresholds
Green highlight denotes an impacted location under either action alternative where the v/c is lower than No Action alternative
Yellow highlight denotes impacted location under either action alternative where the v/c is higher than No Action alternative
Blue highlight denotes a contributing impacted location where the v/c is lower than No Action alternative but has already exceed LOS threshold under Existing Conditions
Purple highlight denotes a contributing impacted location where the v/c is higher than No Action alternative and has already exceed LOS threshold under Existing Conditions
Calculation was based on counts; however, due to downstream congestion, actual demand on freeway mainline segments may be higher.

4.4 IMPACTS AND MITIGATION MEASURES

Described in this section are potential impacts on intersections, roadway segments, freeway mainline segments and freeway ramps, and mitigation measures to lessen the impacts. Potential impacts are identified if the performance threshold, e.g., LOS, is exceeded when compared to Existing Conditions, or the v/c ratio is higher than that of Existing Conditions if the threshold is already exceeded under Existing Conditions. The City of Concord's policy is to implement Transportation Demand Management (TDM) measures rather than roadway widening or other measures that would increase capacities. This policy supports regional, state, and national goals and policies that address reduction of greenhouse gas emissions through reduced automobile travel and increased transit, bicycle and walk trips. However, the effects of potential TDM measures are not assumed in this analysis, unless the TDM measure, such as enhanced bus service, is inherently captured within the mode choice assumptions of the demand model. At this stage of planning for the reuse of the NWS site, no specific development plans have been proposed. To identify or attempt to measure the effect of TDM measures on traffic and transportation impacts would be speculative. Therefore, mitigation in this study is presented for context, in order to illustrate the extent of each impact, rather than as measures that would be required by the City and implemented by specific developers of the NWS site.[16]

The City of Concord's General Plan has established a policy to "use impact fees, development agreements, and other funding mechanisms to construct the transportation system and support TDM programs on the Concord Reuse NWS site, including transit services and facilities."[17] TDM programs could potentially reduce the number of vehicles on the roadway network and lessen potential impacts of the project. TDM strategies may include financial, system and demand incentives that provide reasons for motorists to switch transportation modes, carpool, eliminate or reduce the number of vehicle trips. Examples of the three types of incentives are provided below:

- Financial Incentives: employee travel allowance, parking cash out and transit pass
- System Incentives: park and ride lots, shuttle service to BART, and bicyclist facilities such as secure bicycle parking and changing areas, lockers and showers
- Demand Incentives: rideshare and vanpool programs, car- or bike-sharing programs, preferred parking for carpools, and guaranteed ride home

The specifics of such programs have not been developed and their effects are not readily quantifiable, therefore beneficial effects from these programs are not included in this analysis.

Recognizing the need to identify funding to address transportation issues that are regional in nature, such as those on the freeway facilities and RRS, TRANSPAC has established a Subregional Transportation Mitigation Fee (STMF) Program that requires developments to pay a traffic impact fee

[16] City of Concord, Concord Community Reuse Project Final EIR, January 15, 2010, p. 4-66.
[17] City of Concord, Concord 2030 General Plan, Policy T-1.2.3, p 5-23.

based on the number of trips generated. The City of Concord intends to require future developers at the NWS site to contribute to the program to address issues that have been or will be identified.[18]

4.4.1 No Action Alternative

4.4.1.1 Intersections

The No Action alternative would result in level of service below the performance thresholds at the following nine intersections:

- Farm Bureau Road and Willow Pass Road (#3)
- I-680 Northbound Off Ramp and Ygnacio Valley Road (#14)
- Willow Pass Road and Evora Road (West) (#18)
- Willow Pass Road and Avila Road (#21)
- Willow Pass Road and Evora Road (East)/SR 4 westbound off-ramp (#22)
- San Marco Boulevard/Willow Pass Road and SR 4 eastbound ramps (#23)
- Bailey Road and SR 4 eastbound ramps/BART access (#26)
- Railroad Avenue and W. Leland Road (#27)
- Kirker Pass Road and James Donlon Boulevard (#28)

The level of service at the Bailey Road and SR 4 eastbound ramps/BART access (#26) intersection is already LOS F under existing conditions. The volume to capacity ratio is projected to increase in the future.

4.4.1.2 Roadway Segments

Under the No Action alternative, the Bailey Road segment east of Concord Boulevard (B) would exceed the performance threshold during the AM peak hour.

4.4.1.3 Freeway Mainline Segments

The results indicate that the SR 4 portion between Bailey Road and SR 242 is projected to be over capacity in the westbound direction in the AM peak hour; while a shorter portion between Port Chicago Highway and San Marco Boulevard would be over capacity in the eastbound direction in the PM peak hour. Four westbound segments would operate at LOS F in the AM peak hour and two eastbound segments would have LOS F conditions in the PM peak hour:

- SR 4 east of SR 242 (H)
    - Westbound (AM)
- SR 4 east of Port Chicago Highway (I)

[18] City of Concord, Concord Community Reuse Project Final EIR, January 15, 2010.

  - Westbound (AM)
  - Eastbound (PM)
- SR 4 east of Willow Pass Road (AM) (J)
  - Westbound (AM)
  - Eastbound (PM)
- SR 4 east of San Marco Boulevard (K)
  - Westbound (AM)

4.4.1.4 Freeway Ramps

In the AM peak hour, eight ramps serving westbound SR 4 would be below LOS performance threshold with the No Action alternative, while in the PM peak hour, one ramp serving Interstate 680 and four ramps serving SR 4 would be below LOS performance thresholds with the No Action alternative:

- SR 4 westbound on ramps from (AM):
  - Willow Pass Road (#12)
  - Southbound San Marco Boulevard (#15)
  - Northbound San Marco Boulevard (#16)
  - Bailey Road (#20)
  - Railroad Avenue (#21)
- SR 4 westbound off-ramps to (AM):
  - Port Chicago Highway (#11)
  - Willow Pass Road (#13)
  - San Marco Boulevard (#18)
- I-680 northbound off-ramp to (PM):
  - Willow Pass Road (#1)
- SR 4 eastbound off ramps to (PM):
  - Port Chicago Highway (#7)
  - Willow Pass Road (#9)
  - San Marco Boulevard (#14)
- SR 4 eastbound on-ramps from (PM):
  - Port Chicago Highway (#8)

The heavy ramp volumes in the peak direction of SR 4 may be attributed to congestion on the freeway mainline segment, which would prompt some motorists to seek alternative routes. These motorists would exit and re-enter the freeway depending on traffic conditions to travel to parallel routes such as Willow Pass Road, Evora Road, and W. Leland Road; thereby adding traffic to the merge and diverge areas of the freeway thus contributing to the unstable freeway condition.

4.4.1.5 MTSO Segment Delay Index

The delay index along the Central and East county corridors of Interstate 680, SR 4 and SR 242 and the HOV lane utilization in East County would also be within MTSO standards under the No Action alternative.

4.4.2 Alternative 1: Concord Reuse Project Area Plan

4.4.2.1 Intersections

A total of twelve intersections would be impacted by the implementation of Alternative 1. They include all impacted locations under the No Action Alternative with the exception of Farm Bureau Road and Willow Pass Road (#3) intersection and the following four intersections:

- Port Chicago Highway and Panoramic Drive (#1)
- Willow Pass Road and SR 4 westbound ramps (#19)
- Willow Pass Road and SR 4 eastbound ramps (#20)
- San Marco Boulevard and West Leland Road (#24)

At Farm Bureau Road and Willow Pass Road (#3) intersection, it is projected that level of service would improve to within standards with implementation of Alternative 1 due to increased availability of alternative routes resulting fromthe proposed roadway network and related connectivity on the NWS site.

Impact 1-1: The addition of traffic generated by full development of Alternative 1 would cause **Port Chicago Highway and Panoramic Drive (#1)** intersection to degrade to LOS F during both AM and PM peak hours.

Mitigation Measure 1-1: Implementation of the following measures would result in LOS E conditions, which is within the performance threshold:

- Widen the east leg on Panoramic Drive to add one westbound right turn lane to provide two left-turn lanes, one shared through-right turn lane, and two right-turn lanes;
- Convert the northbound exclusive right-turn lane to a shared through-right turn lane; and
- Widen the north leg on Point Chicago Highway to accommodate three northbound receiving lanes.

Because Port Chicago Highway is constrained by the BART track, implementation may not be feasible.

Impact 1-2: The addition of traffic generated by full development of Alternative 1 would contribute to future substandard conditions at **I-680 Northbound Off Ramp and Ygnacio Valley Road (#14)** intersection during both AM and PM peak hours. However, the v/c ratio is the same as or lower than that of the No Action alternative.

Mitigation Measure 1-2: Accounting for the right-turn on red movements after stop for the northbound approach from the off-ramp to Ygnacio Valley Road would improve the intersection to LOS E (v/c 0.99 or less) in the AM and PM peak hour, which would meet the performance threshold of LOS E.

Impact 1-3: The addition of traffic generated by full development of Alternative 1 would contribute to future substandard conditions at **Willow Pass Road and Evora Road (West) (#18)** intersection during both AM and PM peak hours.

Mitigation Measure 1-3: Implementation of the following measures would improve the intersection to LOS F (v/c 1.19) in the AM peak hour and LOS D (v/c 0.84) in the PM peak hour, which are better than the results of the No Action alternative, but would still exceed the performance threshold of LOS mid-D in the AM peak hour:

- Widen the west leg on Evora Road to add a shared through-right lane on the eastbound approach to provide one shared left-through lane and one shared through-right lane;
- Widen the east leg on Evora Road to add one exclusive left-turn lane on the westbound approach to provide two left-turn lanes and one shared through-right lane;
- Widen the south leg on Willow Pass Road to add an exclusive left-turn lane on the northbound approach to provide one left-turn lane, one shared left-through lane, and one free right-turn lane; and
- Widen the east leg to provide a dedicated receiving lane for the free northbound right-turn traffic and a receiving lane for the eastbound through traffic.

Further widening of Evora Road to accommodate triple left-turn lanes and double right-turn lanes would improve results to be within the performance threshold. This widening may not be feasible due to right of way constraints.

Impact 1-4: The addition of traffic generated by the full development of Alternative 1 would cause the **Willow Pass Road and SR 4 westbound ramps (#19)** intersection to degrade to LOS F during the AM peak hour.

Mitigation Measure 1-4: Implementation of the following measures would result in LOS D (v/c 0.83) in the AM peak hour which is within the performance threshold:

- Widen the north leg on Willow Pass Road to add one southbound through lane to provide three through lanes and one right-turn lane;
- Widen the east leg of the SR 4 off-ramp to add one westbound left-turn lane and to convert the shared left-through lane to a shared left-through-right turn lane to provide two left-turn lanes, one shared left-through-right turn lane, and one right-turn lane; and
- Widen the south left on Willow Pass Road to accommodate three southbound receiving lanes.

Impact 1-5: The addition of traffic generated by the full development of Alternative 1 would cause **Willow Pass Road and SR 4 eastbound ramps (#20)** intersection to degrade to LOS E in the PM peak hour.

Mitigation Measure 1-5: Implementation of the following measures would result in LOS D (v/c 0.85) and LOS C (0.79) in the AM and PM peak hour, respectively, which are at or better than the performance threshold:

- Add one additional southbound left-turn lane to provide two left-turn lanes and two through lanes; and
- Modify the east leg to accommodate two eastbound receiving lanes.

Impact 1-6: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions at **Willow Pass Road and Avila Road (#21)** intersection during both AM and PM peak hours.

Mitigation Measure 1-6: Implementation of the following measures would improve the v/c ratio to 1.03 and 1.02 in the AM and PM peak hours, respectively, which are better than No Action conditions but the results would remain at LOS F and would exceed the performance threshold:

- Convert the westbound right-turn lane on Avila Road to a shared through-right turn lane to provide one left turn lane, one through lane, and one shared through-right turn lane;
- Convert the eastbound right-turn lane on Avila Road to a shared through-right turn lane to provide one left turn lane, one through lane, and one shared through-right turn lane; and
- Widen the east leg and the west leg on Avila Road to accommodate two receiving lanes in either direction.

Further enlargement of the intersection would improve the results to lower than the performance threshold. Further widening of Willow Pass Road to one additional through lane on both northbound and southbound directions; as well as providing two southbound right-turn lanes and two westbound left-turn lanes would improve the results to below performance thresholds in both peak hours. However, such improvement may not be feasible due to right-of-way constraints.

Impact 1-7: The addition of traffic generated by full development of Alternative 1 would contribute to future substandard conditions of LOS F at **Willow Pass Road and Evora Road (East)-SR 4 westbound off-ramp (#22)** intersection during the AM peak hour.

Mitigation Measure 1-7: Implementation of the following measures would improve the intersection to LOS E, which is better than the No Action alternative but it would still exceed the performance threshold:

- Convert one northbound through lane on Willow Pass Road to a left-turn lane to provide two left-turn lanes and two through lanes; and
- Convert the southbound shared through-right lane on Willow Pass Road to an exclusive right-turn lane to provide three through lanes and one right-turn lane.

Widening Willow Pass Road to provide four southbound through lanes and two right-turn lanes would improve the results to meet the performance threshold. However, the right-of-way may be constrained by a creek, making this measure infeasible to implement.

Impact 1-8: The addition of traffic generated by full development of Alternative 1 would cause **San Marco Boulevard-Willow Pass Road and SR 4 eastbound ramps (#23)** intersection to degrade from LOS D to LOS F in the AM peak hour and contribute to future substandard LOS F condition in the PM peak hour.

Mitigation Measure 1-8: Implementation of the following measure would improve the intersection to LOS D (v/c 0.85 and 0.81) in both peak hours which are within the performance threshold of LOS mid-D:

- Add one eastbound right-turn lane and convert one of the left-turn lanes to a shared left-right turn lane at the SR 4 off-ramp to provide one left-turn lane, one shared left-right turn lane and two right-turn lanes; and
- Widen the south leg on Willow Pass Road to accommodate three receiving lanes.

Impact 1-9: The addition of traffic generated by full development of Alternative 1 would cause **San Marco Boulevard and West Leland Road (#24)** intersection to degrade to below the 0.85 v/c threshold for LOS mid-D in the AM peak hour.

Mitigation Measure 1-9: Implementation of the following measure would improve the intersection to LOS D (v/c 0.85) in the AM peak hour, which is within the performance threshold of LOS mid-D:

- Modify signal timing to allow for only permitted left-turns for eastbound approach.

Other measures such as widening approaches to allow for additional through lanes on San Marco Boulevard or West Leland Road would improve the results to lower than the LOS mid-D threshold, but would significantly enlarge the intersection and would not be considered feasible due to right-of-way constraints.

Impact 1-10: The addition of traffic generated by full development of Alternative 1 would contribute to substandard conditions in the PM peak hour at **Bailey Road and SR 4 eastbound ramps-BART access (#26)** intersection, which would have LOS F with a v/c ratio of 1.11 under Existing Conditions and 1.36 under No Action conditions.

Mitigation Measure 1-10: Implementation of the following measure would reduce the v/c ratio to 1.11 which is below No Action conditions and the same as Existing Conditions:

- Convert the eastbound through lane to an exclusive left-turn lane from the BART access road and widen the SR-4 eastbound off-ramp to add a right-turn lane to provide one left-turn lane, one shared left-through lane, and two right-turn lanes on the westbound approach;

- Remove one of the southbound left-turn lanes to provide one left turn lane, two through lanes and one right-turn lane on the southbound approach; and
- Modify the traffic signal to provide protected left-turn phasing.

Due to right-of-way constraints, implementation of these measures may be infeasible.

Impact 1-11: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard LOS D and LOS E conditions in the AM and PM peak hours at the **Railroad Avenue and W. Leland Road (#27)** intersection. However, the v/c ratio of 0.86 in the AM peak hour under Alternative 1 is lower than that of No Action conditions (0.88).

Mitigation Measure 1-11: Implementation of the following measure would improve the intersection to LOS C in the AM peak hour and LOS D (v/c 0.81) in the PM peak hour, which is within the performance threshold of LOS mid-D:

- Widen the north leg on Railroad Avenue to add a southbound left-turn lane to provide two left-turn lanes, two through lanes and one right-turn lane; and
- Widen the west leg on W. Leland Road to add an eastbound right-turn lane to provide one left-turn lane, two through lanes and one right-turn lane.

The intersection is constrained by existing land uses so that implementation may be infeasible.

Impact 1-12: The addition of traffic generated by the full development of Alternative 1 would contribute to future LOS F substandard conditions in the AM peak hour and would degrade the service level from LOS D to LOS F in the PM peak hour at the **Kirker Pass Road and James Donlon Boulevard (#28)** intersection.

Mitigation Measure 1-12: Implementation of the following measure would improve the intersection to LOS D in the AM and PM peak hours, which is better than the No Action, but would still exceed the performance threshold of mid-LOS D:

- Convert the westbound right-turn lane to a shared left-right turn lane to provide one shared left turn lane and one shared left-right turn lane on the westbound approach on James Donlon Boulevard.

4.4.2.2 Roadways

Under Alternative 1 conditions, the service levels of two segments would exceed LOS performance thresholds. The segment of Baily Road east of Concord Boulevard (B) would experience LOS E during the AM peak hour where the performance threshold is LOS D. The segment of Port Chicago Highway north of Olivera Road (D) would degrade to LOS F conditions during both AM and PM peak hours under Alternative 1 where the threshold is LOS E.

Impact 1-13: The addition of traffic generated by the full development of Alternative 1 would cause the level of service along **the Bailey Road segment east of Concord Boulevard (B)** to degrade to LOS E

during the AM peak hour. However, the v/c ratio under Alternative 1 is lower than that of the No Action alternative, which would experience LOS F conditions. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 1-13: None identified**.**

Impact 1-14: The addition of traffic generated by full development of Alternative 1 would cause level of service along **the Port Chicago Highway segment north of Olivera Road (D)** to degrade to LOS F, which exceeds performance threshold during both peak hours.

Mitigation Measure 1-14: Widening Port Chicago Highway to provide two travel lanes in each direction would improve the level of service to within the performance threshold; however, the roadway is constrained by BART tracks so implementation may be infeasible.

4.4.2.3 Freeway Mainline Segments

The same four westbound segments of SR 4 impacted under the No Action alternative during the AM peak hour would also have LOS F condition with the implementation of Alternative 1 and the same two eastbound segments impacted under the No Action alternative during the PM peak hour would also have LOS F conditions with the implementation of Alternative 1. Furthermore, the eastbound SR 4 segment east of San Marco Boulevard would degrade to LOS F in the PM peak hour where it would have LOS E conditions with the No Action alternative.

Impact 1-15: The addition of traffic generated by full development of Alternative 1 would contribute to future substandard conditions along the **SR 4 segment east of SR 242 (H)** in the westbound direction **i**n the AM peak hour. However, the v/c ratio under Alternative 1 is lower than that of the No Action alternative. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 1-15: None identified.

Impact 1-16: The addition of traffic generated by full development of Alternative 1 would contribute to future substandard conditions along the **SR 4 segment east of Port Chicago Highway (I)** in the westbound direction **i**n the AM peak hour and in the eastbound direction in the PM peak hour. However, the v/c ratio under Alternative 1 is lower than that of the No Action alternative. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 1-16: None identified.

Impact 1-17: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions along the **SR 4 segment east of Willow Pass Road (J)** in the westbound direction **i**n the AM peak hour and in the eastbound direction in the PM peak hour.

Mitigation Measure 1-17: Implementation of the ramp metering project scheduled for September 2013 may improve congestion on SR 4; however, any potential effects are not included in the analysis. Widening SR 4 to increase capacity on the segment would improve the conditions to within performance standard. However, such improvement has not been planned or programmed by the agencies responsible for freeway network operations. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 1-18: The addition of traffic generated by full development of Alternative 1 would contribute to future substandard conditions along the **SR 4 segment east of San Marco Boulevard (K)** in the westbound direction in the AM peak hour and would cause the eastbound direction along the same segment to degrade to LOS F in the PM peak hour.

Mitigation Measure 1-18: Implementation of the ramp metering project scheduled for September 2013 may improve congestion on SR 4; however, any potential effects are not included in the analysis. Widening SR 4 to increase capacity on the segment would improve the conditions to within performance standard. However, such improvement has not been planned or programmed by the agencies responsible for freeway network operations. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

4.4.2.4 Freeway Ramps

The results indicate that Alternative 1 would have considerable effect on ramps serving SR 4 during both AM and PM peak hours even though most of these ramps would experience substandard conditions even under No Action alternative. In the AM peak hour, the same eight ramps that would be impacted under No Action scenario would also have LOS F condition with the implementation of Alternative 1. Similarly, in the PM peak hour, the same five ramps that would be adversely affected under No Action scenario would also experience substandard conditions with the implementation of Alternative 1. Further, three SR 4 ramps would degrade to substandard conditions in the PM peak hours where they would have LOS D under No Action alternative. The westbound on-ramp from Port Chicago Highway (#10) would experience LOS E; while the eastbound on-ramp from northbound San Marco Boulevard (#17) and the eastbound off-ramp to southbound Bailey Road (#19) would degrade to LOS F.

Impact 1-19: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **Interstate 680 northbound off-ramp onto Willow Pass Road (#1)** in the PM peak hour. However, the v/c ratio remains the same as that of the No Action alternative. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 1-19: None identified.

Impact 1-20: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 eastbound off-ramp to Port Chicago Highway (#7)** in the PM peak hour. However, the v/c ratio is lower than that of the No Action alternative. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 1-20: None identified.

Impact 1-21: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 eastbound on-ramp from Port Chicago Highway (#8)** in the PM peak hour. However, the v/c ratio is lower than that of the No Action alternative. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 1-21: None identified.

Impact 1-22: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 eastbound off-ramp to Willow Pass Road (#9)** in the PM peak hour. However, the v/c ratio is lower than that of the No Action alternative. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 1-22: None identified.

Impact 1-23: The addition of traffic generated by the full development of Alternative 1 would cause **SR 4 westbound on-ramp from Port Chicago Highway (#10)** to degrade to LOS E in the PM peak hour. The increased volume on the ramp due to Alternative 1 results in a v/c of 0.97 and density of 37.97 passenger car per mile per lane (pc/mi/ln), which exceeds the LOS D threshold of 35 pc/mi/ln.

Mitigation Measure 1-23: No improvement has been planned or programmed to address this issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements and TDM programs that would alleviate congestion on regional facilities and support alternative modes.

Impact 1-24: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 westbound off-ramp to Port Chicago Highway (#11)** in the AM peak hour. However, the v/c ratio is lower than that of the No Action alternative. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 1-24: None identified.

Impact 1-25: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 westbound on-ramp from Willow Pass Road (#12)** in the AM peak hour. However, the v/c ratio is lower than that of the No Action alternative. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 1-25: None identified.

Impact 1-26: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 westbound off-ramp to Willow Pass Road (#13)** in the AM peak hour.

> **Mitigation Measure 1-26:** This interchange is programmed to be reconstructed to improve access and is currently scheduled for completion by 2020.[19,20] The improvement may alleviate the substandard conditions of this ramp. However, any potential effects are not included in this analysis because details of the project are not known at this time.

Impact 1-27: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 eastbound off-ramp onto San Marco Boulevard (#14)** in the PM peak hour. The heavy ramp volume may be attributed to motorists intending to use parallel routes to avoid congestion on SR 4 to the east and are leaving the freeway mainline at this point.

> **Mitigation Measure 1-27:** No improvement has been planned or programmed to address this regional corridor issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 1-28: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 westbound on-ramp from southbound San Marco Boulevard (#15)** in the AM peak hour. The heavy ramp volume may be attributed to some motorists using parallel routes to avoid congestion on SR 4 to the east and are entering the freeway at this point.

> **Mitigation Measure 1-28:** No improvement has been planned or programmed to address this regional corridor issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 1-29: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 westbound on-ramp from northbound San Marco Boulevard (#16)** in the AM peak hour. The heavy ramp volume on this single-lane on-ramp may be attributed to motorists using parallel routes to avoid congestion on SR 4 to the east and are entering the freeway at this point.

> **Mitigation Measure 1-29:** No improvement has been planned or programmed to address this regional corridor issue. Future developers of the NWS site would contribute to TRANSPAC's

[19] Metropolitan Transportation Commission, Final Transportation 2035 Plan, April 22, 2009.
[20] Contra Costa Transportation Authority, Measure J Strategic Plan – July 2011 Project Fact Sheet: Willow Pass Road/SR 4 Ramp Reconstruction.

STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 1-30: The addition of traffic generated by the full development of Alternative 1 would cause **SR 4 eastbound on-ramp from northbound San Marco Boulevard (#17)** to degrade to LOS F in the PM peak hour. The heavy ramp volume on this single-lane on-ramp may be attributed to motorists using parallel routes to avoid congestion on SR 4 to the west and are re-entering the freeway at this point.

Mitigation Measure 1-30: No improvement has been planned or programmed to address this regional corridor issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements and TDM programs that would alleviate congestion on regional facilities.

Impact 1-31: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 westbound off-ramp onto San Marco Boulevard (#18)** in the AM peak hour. The heavy ramp volume may be attributed to motorists intending to use parallel routes to avoid congestion on SR 4 to the west and are leaving the freeway mainline at this point.

Mitigation Measure 1-31: No improvement has been planned or programmed to address this regional corridor issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements and TDM programs that would alleviate congestion on regional facilities.

Impact 1-32: The addition of traffic generated by the full development of Alternative 1 would cause **SR 4 eastbound off-ramp to southbound Bailey Road (#19)** to degrade to LOS F in the PM peak hour. The increased volume on the ramp due to Alternative 1 results in a v/c of 1.09 and density of 37.62 passenger car per mile per lane (pc/mi/ln), which exceeds the LOS D threshold of 35 pc/mi/ln.

Mitigation Measure 1-32: No improvement has been planned or programmed for this location. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements and TDM programs that would alleviate congestion on regional facilities.

Impact 1-33: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 westbound on-ramp from Bailey Road (#20)** in the AM peak hour. The ramp condition may be attributed to high volumes on both the ramp merge area and the mainline onto where traffic is merging.

Mitigation Measure 1-33: No improvement has been planned or programmed for this location. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements and TDM programs that would alleviate congestion on regional facilities.

Impact 1-34: The addition of traffic generated by the full development of Alternative 1 would contribute to future substandard conditions on **SR 4 westbound on-ramp from Railroad Avenue (#21)** in the AM peak hour. The ramp condition may be attributed to high volumes on both the ramp merge area and the mainline onto where traffic is merging.

> **Mitigation Measure 1-34:** No improvement has been planned or programmed for this location. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements and TDM programs that would alleviate congestion on regional facilities.

4.4.2.5 MTSO Segment Delay Index

The delay index along the Central County and East County corridors of Interstate 680, SR 4 and SR 242 would be within MTSO standards with the implementation of Alternative 1. The HOV lane utilization on SR 4 in East County would also meet the MTSO standard.

4.4.3 Alternative 2: Intensified Reuse

4.4.3.1 Intersections

A total of thirteen intersections would be impacted by the implementation of Alternative 2. All of these intersections are also impacted under Alternative 1, with the exception of the intersection of Farm Bureau Road and Willow Pass Road (#3), which would degrade to LOS E during the PM peak hour.

Impact 2-1: The addition of traffic generated by the full development of Alternative 2 would cause **Port Chicago Highway and Panoramic Drive (#1)** to degrade to LOS F during both AM and PM peak hours.

> **Mitigation Measure 2-1:** Implementation of Mitigation Measure 1-1 would result in LOS E in the AM and PM peak hours, improving the intersection to within the performance threshold. However, due to physical constraints, implementation of the mitigation measure may be infeasible.

Impact 2-2: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions at **Farm Bureau Road and Willow Pass Road (#3)** intersection during the PM peak hour. However, the v/c ratio is less than that of the No Action alternative.

> **Mitigation Measure 2-2:** Implementation of the following measure would improve the intersection to LOS D in the PM peak hour, which is within the performance threshold of LOS D:
>
> - Restripe the southbound approach of E. Olivera Road to add a second lane turn lane to provide two left-turn lanes, one through lane and one right-turn lane.
>
> The intersection is constrained by existing land uses along Willow Pass Road and the adjacent Contra Costa Canal, so that implementation may be infeasible.

Impact 2-3: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions at **I-680 Northbound Off Ramp and Ygnacio Valley Road (#14)** intersection during both AM and PM peak hours. However, the v/c ratios are the same as or lower than that of the No Action alternative.

Mitigation Measure 2-3: Implementation of Mitigation Measure 1-2 would improve the intersection to LOS E (v/c 0.99 or less) in the AM and PM peak hour, which would meet the performance threshold of LOS E.

Impact 2-4: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard LOS F condition at **Willow Pass Road and Evora Road (West) (#18)** intersection during both AM and PM peak hours.

Mitigation Measure 2-4: Implementation of the following measures would improve the intersection to LOS F (v/c 1.39) in the AM peak hour and LOS D (v/c 0.82) in the PM peak hour which are the same or better as the results of the No Action alternative but would still exceed the performance threshold of LOS mid-D in the AM peak hour:

- Widen the west leg on Evora Road to add two exclusive right-turn lanes on the eastbound approach to provide one shared left-through lane and two right-turn lanes;
- Widen the east leg on Evora Road to add one exclusive left-turn lane on the westbound approach to provide two left-turn lanes and one shared through-right lane
- Widen the south leg on Willow Pass Road to add an exclusive left-turn lane on the northbound approach to provide one left-turn lane, one shared left-through lane, and one free right-turn lane; and
- Widen the east leg to provide a dedicated lane to receive free northbound right-turn traffic.

Significant enlargement of the intersection to accommodate quadruple left-turn lanes would improve the results to be within the performance threshold. These improvements are not considered to be feasible due to right-of-way constraints.

Impact 2-5: The addition of traffic generated by full development of Alternative 2 would cause **Willow Pass Road and SR 4 westbound ramps (#19)** intersection to degrade to LOS F during the AM peak hour.

Mitigation Measure 2-5: Implementation of Mitigation Measure 1-4 would result in LOS D (v/c 0.84) in the AM peak hour which is within the performance threshold.

Impact 2-6: The addition of traffic generated by the full development of Alternative 2 would cause **Willow Pass Road and SR 4 eastbound ramps (#20)** intersection to degrade to LOS F in the AM peak hour and LOS E in the PM peak hour.

Mitigation Measure 2-6: Implementation of the following measures would result in LOS C in the AM and PM peak hours which are better than the performance threshold:

- Add one eastbound left-turn lane on the SR 4 off-ramp to provide one left-turn lane, one shared left-through lane, and one right-turn lane; and
- Convert one southbound left-turn lane to a through lane on Willow Pass Road to provide one left-turn lane and three through lanes;
- Widen the south leg to accommodate two southbound receiving lanes.

Impact 2-7: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard LOS F condition at **Willow Pass Road and Avila Road (#21)** intersection during both AM and PM peak hours.

Mitigation Measure 2-7: Implementation of the following measures would improve the intersection to LOS F (v/c 1.01) in the AM peak hour and LOS D (v/c 0.89) in the PM peak hour, which are better than No Action conditions; but the results would still exceed the performance threshold of LOS mid-D:

- Convert the westbound right-turn lane to a shared through-right turn lane on Avila Road to provide one left turn lane, one through lane, and one shared through-right turn lanes;
- Add an eastbound left-turn lane on Avila Road to provide two left turn lanes, one through lane, and one shared through-right turn lane; and
- Widen the east leg and the west leg on Avila Road to accommodate two receiving lanes.

Widening of both Willow Pass Road and Avila Road to provide three through lanes on the westbound and northbound approaches would improve the service levels to be within performance thresholds.

Impact 2-8: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard LOS F condition at **Willow Pass Road and Evora Road (East)-SR 4 westbound off-ramp (#22)** intersection during the AM peak hour.

Mitigation Measure 2-8: Implementation of Mitigation Measure 1-7 would reduce the v/c from 1.26 to 1.00 but the service level would remain at LOS F in the AM Peak hour. While this is better than the No Action alternative, it would still exceed the performance threshold of LOS mid-D.

Widening Willow Pass Road and Evora Road to accommodate three northbound left-turn lanes and an exclusive southbound right-turn lane would improve the results to meet the performance threshold. However, such a measure may be infeasible due to the right-of-way constraints.

Impact 2-89: The addition of traffic generated by full development of Alternative 2 would cause **San Marco Boulevard-Willow Pass Road and SR 4 eastbound ramps (#23)** intersection to degrade to LOS F in the AM peak hour and contribute to future substandard LOS F conditions in the PM peak hour.

Mitigation Measure 2-9: Implementation of Mitigation Measure 1-8 would improve the intersection to LOS D (v/c 0.85) in the AM peak hour and LOS C in the PM peak hour, which are within the performance threshold of LOS mid-D.

Impact 2-10: The addition of traffic generated by full development of Alternative 2 would cause **San Marco Boulevard and West Leland Road (#24)** intersection to degrade to below the 0.85 v/c threshold for LOS mid-D in the AM and PM peak hour.

> **Mitigation Measure 2-10:** Implementation of Mitigation Measure 1-9 would improve the intersection to LOS C (v/c 0.79) and LOS D (v/c 0.82) in the AM and PM peak hours, which is within the performance threshold of LOS mid-D.

Impact 2-11: The addition of traffic generated by full development of Alternative 2 would contribute to substandard LOS F conditions in the PM peak hour at **Bailey Road and SR 4 eastbound ramps-BART access (#26)** intersection.

> **Mitigation Measure 2-11:** Implementation of Mitigation Measure 1-10 would improve the intersection to LOS F with a v/c ratio of 1.10 in the PM peak hour which is better than Existing Conditions. However, implementation of the measure may be infeasible due to physical constraints.

Impact 2-12: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard LOS D and LOS E conditions in the AM and PM peak hours at **Railroad Avenue and W. Leland Road (#27)** intersection. However, the v/c ratio of 0.87 in the AM peak hour under Alternative 2 is lower than that of No Action conditions (0.88).

> **Mitigation Measure 2-12:** Implementation of Mitigation Measure 1-11 would improve the intersection to LOS D in both AM (v/c 0.80) and PM (v/c 0.83) peak hours, which are within the performance threshold of LOS mid-D. However, the intersection is constrained by existing land uses so that implementation may be infeasible.

Impact 2-13: The addition of traffic generated by full development of Alternative 2 would contribute to future LOS F substandard conditions in the AM peak hour and would degrade the service level from LOS D to LOS F in the PM peak hour at **Kirker Pass Road and James Donlon Boulevard (#28)** intersection.

> **Mitigation Measure 2-13:** Implementation of Mitigation Measure 1-12 would improve the intersection to LOS D in both AM and PM peak hours, which better than the No Action, but would still exceed the performance threshold of mid-LOS D.

4.4.3.2 Roadways

Similar to Alternative 1, the service levels of two segments would exceed LOS performance thresholds. The segment of Baily Road east of Concord Boulevard would experience LOS E during the AM peak hour where the performance threshold is LOS D. The segment of Port Chicago Highway north of Olivera Road would degrade to LOS F conditions during both AM and PM peak hours under Alternative 2 where the threshold is LOS E.

Impact 2-14: The addition of traffic generated by full development of Alternative 2 would cause the level of service along **the Bailey Road segment east of Concord Boulevard (B)** to degrade to LOS E during the AM peak hour. However, the v/c ratio under Alternative 2 is lower than that of the No Action alternative, which would experience LOS F conditions. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 2-14: None identified**.**

Impact 2-15: The addition of traffic generated by the full development of Alternative 2 would cause level of service along the **Port Chicago Highway segment north of Olivera Road (D)** to degrade to LOS F, which exceeds performance threshold during both peak hours.

Mitigation Measure 2-15: Implementation of Mitigation Measure 1-14 would improve the level of service to within the performance threshold; however, the roadway is constrained by BART tracks so implementation may be infeasible.

4.4.3.3 Freeway Mainline Segments

The same freeway mainline segments affected under Alternative 1 would also experience LOS F conditions with the implementation of Alternative 2 during both peak hours.

Impact 2-16: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions along the **SR 4 segment east of SR 242 (H)** in the westbound direction **i**n the AM peak hour. However, the v/c ratio under Alternative 2 is lower than that of the No Action alternative. Therefore, it is not considered to be an adverse impact.

Mitigation Measure 2-16: None identified**.**

Impact 2-17: The addition of traffic generated by the full development of Alternative 2 would contribute to future substandard conditions along the **SR 4 segment east of Port Chicago Highway (I)** in the westbound direction in the AM peak hour and in the eastbound direction in the PM peak hour. While the v/c ratio under Alternative 2 is lower than that of the No Action alternative in the AM peak hour; the v/c ratio is higher than No Action alternative in the PM peak hour. Therefore, the effect of Alternative 2 is considered to be adverse in the PM peak hour.

Mitigation Measure 2-17: Implementation of the ramp metering project scheduled for September 2013 may improve congestion on SR 4; however, any potential effects are not included in the analysis. Widening SR 4 to increase capacity on the segment would improve conditions to within performance standard. However, such improvement has not been planned or programmed by the agencies responsible for freeway network operations. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 2-18: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions along the **SR 4 segment east of Willow Pass Road (J)** in the westbound direction in the AM peak hour and in the eastbound direction in the PM peak hour.

> **Mitigation Measure 2-18:** Implementation of the ramp metering project scheduled for September 2013 may improve congestion on SR 4; however, any potential effects are not included in the analysis. Widening SR 4 to increase capacity on the segment would improve the conditions to within performance standard. However, such improvement has not been planned or programmed by the agencies responsible for freeway network operations. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 2-19: The addition of traffic generated by the full development of Alternative 2 would contribute to future substandard conditions along the **SR 4 segment east of San Marco Boulevard (K)** in the westbound direction in the AM peak hour and would cause the eastbound direction along the same segment to degrade to LOS F in the PM peak hour.

> **Mitigation Measure 2-19**: Implementation of the ramp metering project scheduled for September 2013 may improve congestion on SR 4; however, any potential effects are not included in the analysis. Widening SR 4 to increase capacity on the segment would improve the conditions to within performance standard. However, such improvement has not been planned or programmed by the agencies responsible for freeway network operations. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

4.4.3.4 Freeway Ramps

The same freeway ramps impacted under Alternative 1 would also have substandard conditions with the implementation of Alternative 2 during either the AM or PM peak hour. Furthermore, the results indicate that two SR 4 locations - eastbound off ramp to Willow Pass Road (#9) and westbound on-ramp from Port Chicago Highway (#10) – are projected to experience substandard conditions during the AM peak hour under Alternative 2.)

Impact 2-20: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **Interstate 680 northbound off-ramp onto Willow Pass Road (#1)** in the PM peak hour. However, the v/c ratio is the same as that of the No Action alternative. Therefore, the impact is not considered to be adverse.

> **Mitigation Measure 2-20:** None identified.

Impact 2-21: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **SR 4 eastbound off-ramp to Port Chicago Highway (#7)** in the PM peak hour. However, the v/c ratio is lower than that of the No Action alternative. Therefore, the impact is not considered to be adverse.

Mitigation Measure 2-21: None identified.

Impact 2-22: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **SR 4 eastbound on-ramp from Port Chicago Highway (#8)** in the PM peak hour.

Mitigation Measure 2-22: No improvement has been planned or programmed for this location. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 2-23: The addition of traffic generated by full development of Alternative 2 would cause **SR 4 eastbound off-ramp to Willow Pass Road (#9)** to degrade to LOS F in the AM peak hour and contribute to future substandard conditions in the PM peak hour.

Mitigation Measure 2-23: This interchange is programmed to be reconstructed to improve access and is currently scheduled for completion by 2020.[21,22] The improvement may alleviate the substandard conditions of this ramp. However, any potential effects are not included in this analysis because details of the project are not known at this time.

Impact 2-24: The addition of traffic generated by full development of Alternative 2 would cause **SR 4 westbound on-ramp from Port Chicago Highway (#10)** to degrade to LOS E in the AM peak hour and LOS F in the PM peak hour. The increased volume on the ramp due to Alternative 2 results in a v/c of 0.93 and density of 36.70 passenger car per mile per lane (pc/mi/ln) during the AM peak hour and a v/c of 1.02 and density of 39.95 pc/mi/ln in the PM, which exceeds the LOS D threshold of 35 pc/mi/ln.

Mitigation Measure 2-24: No improvement has been planned or programmed to address this issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements and TDM programs that would alleviate congestion on regional facilities.

Impact 2-25: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **SR 4 westbound off-ramp to Port Chicago Highway (#11)** in the AM peak hour. Since the v/c ratio is lower than that of the No Action alternative in the AM peak hour, the effect of Alternative 2 in the AM peak hour is not considered to be an adverse impact.

Mitigation Measure 2-25: None identified.

Impact 2-26: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **SR 4 westbound on-ramp from Willow Pass Road (#12)** in the AM

[21] Metropolitan Transportation Commission, Final Transportation 2035 Plan, April 22, 2009.
[22] Contra Costa Transportation Authority, Measure J Strategic Plan – July 2011 Project Fact Sheet: Willow Pass Road/SR 4 Ramp Reconstruction.

peak hour. Since the v/c ratio is lower than that of the No Action alternative in the AM peak hour, the effect of Alternative 2 in the AM peak hour is not considered to be an adverse impact.

Mitigation Measure 2-26: None identified.

Impact 2-27: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **SR 4 westbound off-ramp to Willow Pass Road (#13)** in the AM peak hour.

Mitigation Measure 2-27: This interchange is programmed to be reconstructed to improve access and is currently scheduled for completion by 2020.[25,26] The improvement may alleviate the substandard conditions of this ramp. However, any potential effects are not included in this analysis because details of the project are not known at this time.

Impact 2-28: The addition of traffic generated by full development of Alternative 2 would contribute to substandard conditions on **SR 4 eastbound off-ramp onto San Marco Boulevard (#14)** in the PM peak hour. The heavy ramp volume may be attributed to motorists intending to use parallel routes to avoid congestion on SR 4 to the east and are leaving the freeway mainline at this point.

Mitigation Measure 2-28: No improvement has been planned or programmed to address this regional corridor issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements and TDM programs that would alleviate congestion on regional facilities.

Impact 2-29: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **SR 4 westbound on-ramp from southbound San Marco Boulevard (#15)** in the AM peak hour. The heavy ramp volume may be attributed to some motorists using parallel routes to avoid congestion on SR 4 to the east and are entering the freeway at this point.

Mitigation Measure 2-29: No improvement has been planned or programmed to address this regional corridor issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements and TDM programs that would alleviate congestion on regional facilities.

Impact 2-30: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **SR 4 westbound on-ramp from northbound San Marco Boulevard (#16)** in the AM peak hour. The heavy ramp volume on this single-lane on-ramp may be attributed to motorists using parallel routes to avoid congestion on SR 4 to the east and are entering the freeway at this point.

[25] Metropolitan Transportation Commission, Final Transportation 2035 Plan, April 22, 2009.
[26] Contra Costa Transportation Authority, Measure J Strategic Plan – July 2011 Project Fact Sheet: Willow Pass Road/SR 4 Ramp Reconstruction.

Mitigation Measure 2-30: No improvement has been planned or programmed to address this regional corridor issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 2-31: The addition of traffic generated by full development of Alternative 2 would cause **SR 4 eastbound on-ramp from northbound San Marco Boulevard (#17)** to degrade to LOS F in the PM peak hour. The heavy ramp volume on this single-lane on-ramp may be attributed to motorists using parallel routes to avoid congestion on SR 4 to the west and are entering the freeway at this point.

Mitigation Measure 2-31: No improvement has been planned or programmed to address this regional corridor issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 2-32: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **SR 4 westbound off-ramp onto San Marco Boulevard (#18)** in the AM peak hour. The heavy ramp volume may be attributed to motorists intending to use parallel routes to avoid congestion on SR 4 to the west and are leaving the freeway mainline at this point.

Mitigation Measure 2-32: No improvement has been planned or programmed to address this regional corridor issue. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 2-33: The addition of traffic generated by full development of Alternative 2 would cause **SR 4 eastbound off-ramp to southbound Bailey Road (#19)** to degrade to LOS F in the PM peak hour. The increased volume on the ramp due to Alternative 2 results in a v/c of 1.09 and density of 37.46 passenger car per mile per lane (pc/mi/ln), which exceeds the LOS D threshold of 35 pc/mi/ln.

Mitigation Measure 2-33: No improvement has been planned or programmed for this location. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 2-34: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **SR 4 westbound on-ramp from Bailey Road (#20)** in the AM peak hour. The ramp condition may be attributed to high volumes on both the ramp merge area and the mainline onto where traffic is merging.

Mitigation Measure 2-34: No improvement has been planned or programmed for this location. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

Impact 2-35: The addition of traffic generated by full development of Alternative 2 would contribute to future substandard conditions on **SR 4 westbound on-ramp from Railroad Avenue (#21)** in the AM peak hour. The ramp condition may be attributed to high volumes on both the ramp merge area and the mainline onto where traffic is merging.

> **Mitigation Measure 2-35:** No improvement has been planned or programmed for this location. Future developers of the NWS site would contribute to TRANSPAC's STMF program towards transportation improvements that would alleviate congestion on regional facilities.

4.4.3.5 MTSO Segment Delay Index

The delay index along the Central County and East County corridors of Interstate 680, SR 4 and SR 242 would be within MTSO standards with the implementation of Alternative 2. The HOV lane utilization on SR 4 in East County would also meet the MTSO standard.

Appendix H-2 Comparison of Level of Service (LOS) presented in the FEIS for the Disposal and Reuse of the former Naval Weapons Station Seal Beach, Detachment Concord; Concord Community Reuse Plan Final EIR (2010), and Final EIR Addendum and Initial Study of Environmental Significance for the Concord Reuse Project Area Plan (2012)

The following table was prepared in response to a public comment (Comment #24-7) on the Draft EIS requesting an explanation for the differences in the level of service (LOS) results between the Draft EIS and the City of Concord's 2010 FEIR and 2012 Area Plan EIR Addendum. The differences in the LOS results between the EIS and the Reuse Plan EIR and the Area Plan EIR Addendum are discussed in Section 4.11.1, Methodology, of the EIS. These differences in LOS results can be attributed largely to differences in the baseline conditions and the models used to forecast the traffic on area roadways and highways over the approximately 7-year period between when the analysis was completed for the Reuse Plan EIR and when the analysis was completed for the EIS. Appendix H-2 provides a detailed comparison of intersections, roadway segments, freeway segments, and roadway ramps that exceed performance thresholds under Alternative 1 with those that exceed performance thresholds under the Preferred Alternative in the City of Concord's 2010 FEIR and 2012 Area Plan EIR Addendum.

Intersection/Segment/Ramp	**Reuse Plan Final EIR (2010) – Preferred Alternative**				**Final EIR Addendum (2012) – Area Plan**				**FEIS – Alternative 1**				**Explanation for Differences between FEIR/FEIR Addendum and FEIS**

Intersections													
1. Port Chicago Hwy / Panoramic Dr	**F**	**1.04**	E	0.91	**F**	**1.08**	**F**	**1.02**	**F**	**1.02**	**F**	**1.12**	Despite the overall decrease in total intersection volumes, an increase in southbound left and westbound right movements in the p.m. hours, which are critical movements in the calculation, resulted in a higher v/c in the FEIS.
2. Port Chicago Hwy / Olivera Rd	**F**	**1.21**	**F**	**1.34**	**F**	**1.2**	**F**	**1.28**	E	0.95	D	0.85	The LOS change is due to the decrease in volumes in the FEIS.
3. Farm Bureau Rd / Willow Pass Rd	B	0.64	**F**	**1.04**	B	0.63	**F**	**1.05**	B	0.6	D	0.86	The LOS change is due to the decrease in volumes in the FEIS.
4. Commerce Av - SR242 / SB/ Concord Av	E	0.98	**F**	**1.15**					B	0.65	D	0.84	The LOS change is due to the decrease in volumes in the FEIS.
5. West St / Concord Blvd	D	0.89	B	0.66	D	0.89	B	0.65	C	0.72	B	0.64	The LOS change is due to the decrease in volumes in the FEIS.
6. Denkinger Rd / Concord Blvd	C	0.78	C	0.71	C	0.8	B	0.67	A	0.58	B	0.62	The LOS change is due to the decrease in volumes in the FEIS.
7. Bailey Rd / Concord Blvd	C	0.71	B	0.69					C	0.72	A	0.58	The LOS change is due to the decrease in volumes in the FEIS.
8. North Main St / Sunnyvale Av-SB I-680 Ramps	**F**	**1.2**	**F**	**1.12**					E	1	D	0.86	The LOS change is due to the decrease in volumes in the FEIS.
9. North Main St / Geary Rd	**F**	**1.08**	**F**	**1.2**					D	0.84	F	1.02	The LOS change is due to the decrease in volumes in the FEIS.
10. Buskirk Av-NB I-680 Off Ramp / Treat Blvd	F	1.33	**F**	**1.7**					B	0.6	B	0.68	The LOS change is due to the change in lane geometries for the eastbound approach and decreased volumes in the FEIS.
11. Oak Rd / Treat Blvd	**F**	**1.03**	**F**	**1.21**					A	0.6	D	0.8	The LOS change is due to the change in southbound and eastbound lane geometries and decreased volumes in the FEIS.
12. Bancroft Rd / Treat Blvd	E	0.95	**F**	**1.14**					D	0.85	E	0.97	The LOS change is due to the decrease in volumes in the FEIS.
13. Oak Grove Rd / Treat Blvd	**F**	**1.53**	**F**	**1.14**					E	0.97	D	0.84	The LOS change is due to the low baseline count in the FEIS.
14. NB I-680 Off Ramp / Ygnacio Valley Rd	**F**	**1.39**	**F**	**1.49**					**F**	**1**	**F**	**1**	No change in LOS. Decrease in volumes resulted in lower v/c in the FEIS.
15. Bancroft Rd / Ygnacio Valley Rd	E	0.94	D	0.84					D	0.81	D	0.82	The LOS change is due to the decrease in volumes in the FEIS.
16. Oak Grove Rd / Ygnacio Valley Rd	**F**	**1.03**	**F**	**1.31**					E	0.94	E	0.94	The LOS change is due to the decrease in volumes in the FEIS.
17. Ayers Rd / Ygnacio Valley Rd	E	0.97	C	0.72					C	0.74	A	0.59	The LOS change is due to the change in northbound lane geometries and decreased volumes in the FEIS.
18. Willow Pass Rd / Evora Rd (West)	**F**	**1.16**	**F**	**1.27**	**F**	**1.44**	**F**	**1.31**	**F**	**1.91**	**F**	**1.56**	No change in LOS. Increase in volumes resulted in higher v/c in the FEIS.
19. Willow Pass Rd / SR 4 WB ramps	**E**	**0.98**	B	0.7	**E**	**0.99**	C	0.74	**F**	**1.19**	C	0.73	The LOS change is due to an increase in volume in the FEIS.

Intersection/Segment/Ramp	Reuse Plan Final EIR (2010) – Preferred Alternative				Final EIR Addendum (2012) – Area Plan				FEIS – Alternative 1				Explanation for Differences between FEIR/FEIR Addendum and FEIS
	A.M.		P.M.		A.M.		P.M.		A.M.		P.M.		
	LOS	v/c	LOS	v/c	LOS	v/c	LOS	v/c	LOS	v/c	LOS	v/c	
20. Willow Pass Rd / SR 4 EB ramps	**E**	**0.96**	B	0.69	**E**	**0.98**	C	0.73	D	0.85	**E**	**0.96**	Despite the decreased total volume in p.m., an increase in the southbound lane of 405 vehicles results in the dramatic increase in v/c in p.m. in the FEIS.
21. Willow Pass Rd / Avila Rd	**F**	**1.51**	**F**	**1.49**	**F**	**1.22**	**F**	**1.42**	**F**	**1.35**	**F**	**1.26**	No change in LOS. Decrease in volumes resulted in lower v/c in the FEIS.
22. Willow Pass Rd / Evora Rd (East)-SR 4 WB Off Ramp	**F**	**1.01**	D	0.83					**F**	**1.25**	B	0.67	The LOS change in p.m. is due to the decrease in volumes in the FEIS. Increase in a.m. volumes resulted in higher v/c in the FEIS.
23. San Marco Blvd-Willow Pass Rd/SR 4 EB ramps	C	0.7	**E**	**0.99**					**F**	**1.13**	**F**	**1.61**	The LOS change is due to an increase in volumes due to specific development changes at Bay Point PDA.
24. San Marco Blvd / W. Leland Rd	**D**	**0.9**	C	0.78					**D**	**0.89**	D	0.85	In a.m., there are increases in southbound left, eastbound through, and westbound through and decrease in westbound right, but not enough to change v/c in the FEIS. In p.m., the decrease in southbound left and increases in eastbound through and westbound through (which are not as critical as left-turn movements) result in improved v/c to change LOS to D n the FEIS.
25. Bailey Rd / Willow Pass Rd	D	0.88	E	0.96					C	0.78	E	0.92	The LOS change is due to the change in lane geometries for all approaches in the FEIS.
26. Bailey Rd / SR 4 EB ramps-BART access	C	0.78	**F**	**1.87**					D	0.83	**F**	**1.86**	The LOS change is due to the slight increase in volume at the threshold between LOS C in the FEIR and D in the FEIS.
27. Railroad Av / W. Leland Rd	**E**	**0.98**	**F**	**1.31**					**D**	**0.86**	**E**	**1**	The LOS change is due to the decrease in volumes in the FEIS.
28. Kirker Pass Rd / James Donlon Blvd	E	0.99	**F**	**1.09**					**F**	**1.16**	**F**	**1**	The LOS change is due to an increase in volume in the FEIS.
Roadway Segments													
1. Ygnacio Valley Rd - East of Cowell Rd	D	0.99	F	1.08					C	0.7	C	0.63	The LOS change is due to the decrease in volumes in the FEIS.
2. Bailey Rd. - East of Concord Blvd	**F**	**1.25**	**F**	**1.28**					**E**	0.95	D	0.61	The LOS change is due to the decrease in volumes in the FEIS.
3. Concord Blvd. - West of Denkinger Rd	**F**	**1.05**	**F**	**1.02**					D	0.83	D	0.94	The LOS change is due to the decrease in volumes in the FEIS.
4. Port Chicago Hwy - North of Olivera Rd	**F**	**1.8**	**F**	**1.79**	N/A	N/A	**F**	**1.84**	**F**	**1.18**	**F**	**1.17**	No change in LOS.
5. Kirker Pass Rd. - South of Myrtle Dr	C	0.55	D	0.86	C	0.54	N/A	N/A	D	0.81	D	0.74	The LOS change is due to an increase in a.m. volumes in the FEIS. PM volumes decreased in the FEIS which resulted in a lower v/c.
Freeway Segments													
1. I-680 s/o Monument Blvd	NB: C	0.66	**NB: F**	**1.34**					NB: C	0.71	NB: D	0.79	The LOS change is due to the decrease in p.m. volumes and northbound geometric change in the FEIS.
	SB: F	**1.01**	SB: D	0.82					SB: C	0.7	SB: C	0.71	The LOS change is due to the decrease in volumes and southbound geometric change in the FEIS.

Intersection/Segment/Ramp	Reuse Plan Final EIR (2010) – Preferred Alternative				Final EIR Addendum (2012) – Area Plan				FEIS – Alternative 1				Explanation for Differences between FEIR/FEIR Addendum and FEIS
	A.M.		P.M.		A.M.		P.M.		A.M.		P.M.		
	LOS	v/c	LOS	v/c	LOS	v/c	LOS	v/c	LOS	v/c	LOS	v/c	
2. I-680 n/o Monument Blvd.	NB: C	0.57	**NB: F**	**1.12**					NB: C	0.65	NB: C	0.72	The LOS change is due to the decrease in p.m. volumes in the FEIS. In the a.m., the northbound volumes in the FEIS show an increase when compared to the FEIR, except for the segment north of SR 242.
	SB: F	**1.01**	SB: D	0.83					SB: D	0.76	SB: D	0.75	The LOS change is due to the decrease in a.m. volumes in the FEIS.
3. I-680 n/o SR 242	NB: E	0.91	**NB: F**	**2.07**					NB: B	0.52	NB: D	0.76	The LOS change is due to the decrease in volumes and the additional mixed-flow lane northbound in the FEIS. This decrease in northbound AM volume can be attributed to the 2007 counts used in the EIR, which shows very little difference in volumes between the segment n/o Monument (Segment B) and n/o SR 242 (Segment C), such that the northbound volumes on I-680 north of SR 242 in 2007 are higher than that used in the EIS.
	SB: F	**1.45**	**SB: F**	**1.1**					SB: C	0.61	SB: C	0.6	The LOS change is due to geometric changes and significant decrease in volumes in the FEIS.
4. I-680 n/o Willow Pass Rd	NB: B	0.45	**NB: F**	**1.04**					NB: B	0.44	NB: C	0.72	The LOS change is due to northbound geometric changes and significant decrease in p.m. volumes in the FEIS
	SB: D	0.8	SB: C	0.57					SB: C	0.67	SB: C	0.59	The LOS change is due to southbound geometric changes and decrease in volumes in the FEIS.
5. I-680 n/o Concord Ave	NB: B	0.4	**NB: F**	**1.03**					NB: B	0.5	NB: D	0.8	The LOS change is due to the decrease in p.m. volumes in the FEIS.

Subject: Formal Consultation on the Proposed Transfer and Redevelopment of the Former Concord Naval Weapons Station, Contra Costa County, California

Dear Dr. Bottoms and Mr. Lee:

This letter is in response to the U.S. Army Corps of Engineers (Corps) June 12, 2013, and the Department of the Navy's (Navy) October 2, 2013, request for initiation of formal consultation with the U.S. Fish and Wildlife Service (Service) on the proposed transfer and redevelopment of the former Concord Naval Weapons Station (CNWS) (proposed project) located in the City of Concord, Contra Costa County, California. The Corps' letter was received by this field office on June 14, 2013, and the Navy's letter was received on October 18, 2013. At issue are effects to the federally threatened Central California Distinct Population Segment (DPS) of the California tiger salamander (*Ambystoma californiense*) (Central California tiger salamander), threatened California red-legged frog (*Rana draytonii*), endangered San Joaquin kit fox (*Vulpes macrotis mutica*), threatened Alameda whipsnake (*Masticophis lateralis euryxanthus*), and threatened vernal pool fairy shrimp (*Branchinecta lynchi*). The Service has designated critical habitat for Central California tiger salamander, California red-legged frog, Alameda whipsnake, and vernal pool fairy shrimp but no critical habitat lies within the action area, so none will be affected. The Service recommends that the Navy and the Corps encourage the City and East Bay Regional Park District to contact the Service's Migratory Bird Division in the Pacific Southwest Regional Office to assess the need for an eagle take permit and to ensure the proposed project's effects on eagles are consistent with Bald and Golden Eagle Protection Act (16 U.S.C. 668-668d). This response is provided under the authority of the Endangered Species Act of 1973, as amended (16 U.S.C. 1531 *et seq.*) (Act), and in accordance with the implementing regulations pertaining to interagency cooperation (50 CFR 402).

The federal actions on which we are consulting are (1) the Navy's proposed transfer of surplus federal property located within the Inland Area of the CNWS through the federal Base Realignment and Closure (BRAC) process to the City of Concord (City), to the East Bay Regional Park District (EBPRD) through the Department of the Interior, and to the Contra Costa County Sheriff's Department and the Contra Costa County Fire Protection District for subsequent redevelopment in accordance with the Concord Reuse Project Area Plan (Area Plan); and (2) the issuance of a Department of the Army 404 Permit by the Corps to the City for the fill of waters of the U.S. during development-related and conservation-related activities by the City of Concord pursuant to the Area Plan.

Pursuant to 50 CFR 402.12(j), you submitted a biological assessment for our review and requested concurrence with the findings presented therein. These findings conclude that the proposed project may effect, and is likely to adversely affect Central California tiger salamander, California red-legged frog, and Alameda whipsnake. In subsequent communications between the Navy, the Corps, and the Service, it was determined that the proposed project may effect and is not likely to adversely affect San Joaquin kit fox and vernal pool fairy shrimp.

In considering your request, we based our evaluation on the following: (1) information provided in the Corps June 12, 2013, and the Navy's October 2, 2013, letters; (2) the *Biological Assessment for the Concord Reuse Project- Area Plan, Concord, California* (BA), dated May 10, 2013; (3) site visits in May 2010, November 2014, and September 2015; (4) information provided in data responses to the Service's requests for information (see consultation history below); (5) data from Central California tiger salamander trapping and other surveys conducted by the Navy in support of previous remediation work in the Reuse Area; and (6) other information available to the Service.

The Service concurs with the determination that the proposed project may affect, but is not likely to adversely affect the San Joaquin kit fox. This determination is based on the following: (1) the Reuse Area is located at the northernmost edge of the northern portion San Joaquin kit fox range and no San Joaquin kit fox have been documented northwest of Kirker Pass Road which lies south of the Reuse Area; 2) San Joaquin kit fox were not detected during spotlight surveys conducted in the Reuse Area in 1998 and 1999; (3) no San Joaquin kit fox were detected at scent stations or during spotlight surveys conducted in the Reuse Area in 1982; and (4) San Joaquin kit fox have not been documented along the northernmost edge of their range since 1995.

The Service concurs with the determination that the proposed project may affect, but is not likely to adversely affect vernal pool fairy shrimp. This determination is based on the following: (1) the results of dry season sampling within the Reuse Area conducted from 2003 to 2005 which did not detect vernal pool fairy shrimp; (2) the results of protocol-level dry-season and wet-season surveys conducted in 2007 and 2008 within the Reuse Area that also did not detect any vernal pool fairy shrimp; (3) no documented occurrences of vernal pool fairy shrimp occur within 5 miles of the Reuse Area; and (4) the ephemeral pools and ditches within the Reuse Area that provide potential habitat for vernal pool fairy shrimp are located primarily in disturbed portions of the Reuse Area and are unlikely to support vernal pool fairy shrimp based on their quality and hydrology.

The remainder of this document provides our biological opinion on the effects of the proposed project on Central California tiger salamander, California red-legged frog, and Alameda whipsnake.

Consultation History

May 19, 2010:	The Service attended a "kick-off meeting" and site visit hosted by the City to present the proposed project to the resource agencies.
June, 23, 2010:	The Service met with the City to discuss Section 7 and/or Section 10 permitting avenues for the proposed project.
January 13, 2011:	The Service attended a meeting with the City, the Corps, the California Department of Fish and Wildlife (CDFW), and others to discuss coordination of the Corps' NEPA analysis, the Navy Environmental Impact Statement, and the Section 7 consultation.
June 14, 2013:	The Service received the Corps' June 12, 2013, letter requesting initiation of formal consultation on the re-development of the CNWS.
June 23, 2013:	The Service received a letter from the Navy requesting a meeting to discuss Section 7 compliance for the transfer of the CNWS.
July 16, 2013:	The Service met with the Navy to discuss a joint Section 7 consultation with the Navy and the Corps that would address both the transfer and the subsequent reuse of the CNWS.
September 10, 2013:	The Service met with the City, Navy, and Corps. It was determined that the Corps and Navy would participate in a joint formal consultation.
October 18, 2013:	The Service received a letter from the Navy requesting formal consultation and requesting a joint consultation with the Corps.
January 22, 2014:	The Service met with the City and CDFW to discuss coordination of state and federal permitting.
June 16, 2014:	The Service met with the City and Corps to discuss the proposed project including mitigation and mitigation funding structure, City responsibilities in regard to a biological opinion, and anticipated transfer schedule.
October 1, 2014:	The Service met with the Corps and the City to discuss the Service's review of the Biological Assessment for the proposed project.
November 13, 2014:	The Service attended a site visit with the City, East Bay Regional Park District (EBRPD), and CDFW.
December 18, 2014:	The Service sent a letter to the Navy and the Corps requesting additional information needed to initiate consultation.
March 20, 2015:	The Service received a response to the request for additional information from the Navy.

March 30, 2015:	The Service received a letter from the Corps responding to the request for additional information and requesting that the Corps be included in all meetings and correspondence related to the section 7 consultation for the proposed project.
May 27-28, 2015:	The Service met with the Navy, Corps, City, and EBRPD to discuss data needs. The Service provided a follow-up email summarizing information needed to initiate formal consultation.
June - August, 2015:	The Service received letters, memos, and emails from the Navy, City and EBPRD providing data responses with additional information and participated in calls to discuss information provided.
July 2015 to November 2016:	The Service, Navy, Corps, City and EBRPD participated in monthly meetings/calls to develop a final project description.
August 5, 2015:	The Service met with the City and CDFW to update CDFW on the status of the Section 7 consultation.
September 28, 2015:	The Service attended a site visit with the Corps, Navy, City, and EBRPD.
October 24, 2015:	Per the Service's request, the Service received a draft project description that compiled and incorporated the additional information provided by all parties during previous data responses.
December 4, 2015:	The Service sent a letter to the Corps and Navy providing comments on the draft project description received October 24, 2015.
December 11, 2015:	The Service sent a letter to the Navy and the Corps responding to a request, made by the Navy during the December 10, 2015 monthly call, for clarification of the status of formal consultation and an anticipated timeline for completion of a Biological Opinion.
March 10, 2016:	The Service received a revised draft project description.
April 28, 2016:	The Service provided comments on the revised draft project description.
May 2016 to March 2017:	The Service, Navy, Corps, City, and EBRPD exchanged various emails and participated in calls and meetings to develop a final project description for the biological opinion.

BIOLOGICAL OPINION

Description of the Proposed Action

The proposed federal actions are the Navy's transfer of the Inland Area of the CNWS and the Corps' issuance of an individual permit pursuant to Section 404 of the Clean Water Act (33 U.S.C. 1344) (404 permit). The Navy's transfer of the Inland Area and the Corps' 404 permit will facilitate the implementation of the Area Plan, which will include urban development and use (housing,

commercial, parks and recreation, roadways/transportation, and other urban infrastructure), creek restoration, habitat conservation, a Contra Costa County first responder training/command center, and the EBRPD's development of the Concord Hills Regional Park. The regional park will include passive recreation as well as long-term management and maintenance of conservation values within the park. The Corps' 404 permit will authorize the fill of jurisdictional wetlands and other waters of the U.S. during development-related and conservation-related activities by the City of Concord pursuant to the Area Plan.

Project Area and Location

The CNWS is located within the City of Concord on Suisun Bay, approximately 35 miles east-northeast of San Francisco in northern Contra Costa County, California. The facility is composed of a Tidal Area in the northwest and an Inland Area in the southeast. The Area Plan (and the City's 2030 General Plan) covers the Inland Area and two immediately adjacent areas, the City-owned portion of Diablo Creek Golf Course and the North Concord/Martinez Bay Area Rapid Transit (BART) station, in addition to public rights-of-way and easements along roads in and around these areas (hereafter referred to as the Reuse Area or CNWS Reuse Area; see Figure 1). The CNWS Reuse Area is bound on the north by the Los Medanos Hills, on the south by developed areas of the City of Concord, on the east by rangelands and residential development in the City of Pittsburg, and on the west by Port Chicago Highway.

The CNWS Reuse Area encompasses approximately 5,074 acres. It includes the approximately 4,972-acre portion of the Inland Area of the CNWS the Navy will convey from federal ownership, the 24-acre North Concord/Martinez BART station property, the 68-acre City-owned portion of the Diablo Creek Golf Course, and approximately 10 acres of public rights-of-way that the Navy does not own but where the City will make road improvements to facilitate access to the CNWS Reuse Area (Figure 1). The general locations of plant communities in the Reuse Area are shown in Figure 2 and the acreages of each are listed in Table 1.

Table 1. Approximate Acreages of Plant Communities in the Reuse Area

Plant Communities	Area (acres)
California Annual Grassland	4,048.3
Coyote Brush Scrub/Coastal Sage Scrub	4.8
Developed*	529.4
Golf Course/Recreation**	153.2
Oak Woodland/Savannah	107.7
Orchards and Plantations	155.8
Riparian Woodland	35.7
Seasonal and Perennial Wetlands/Aquatic Habitats	-----
Freshwater Marsh	5.8
Seasonal Wetlands	17.9
Creeks, Drainages, Canals, and Ponds	15.4
Total	**5,074.0**

* Includes buildings, roads, parking areas, railroad tracks, and bunkers
** Includes artificial golf course ponds

Project Background

In 2005, the Inland Area of the CNWS was approved for closure by the U.S. Department of Defense (DOD) through the federal Base Realignment and Closure (BRAC) process. Through this

federal process, the City was designated the BRAC Local Reuse Authority (LRA) (71 Fed. Reg. 6274). The Navy has declared approximately 5,028 acres of property at the former CNWS to be surplus to the needs of the federal government in accordance with Public Law 101-510, the Defense Base Closure and Realignment Act of 1990, as amended in 2005. Although the Navy initially declared 5,028 acres surplus, it has been determined that the actual surplus area is approximately 4,972 acres. In 2006, the City began to consider the ultimate re-uses of the Inland Area of the former CNWS. Following an extensive public process and incorporation of input from public health and resource agencies, the City Council, acting as the LRA, adopted a Reuse Plan in 2010, which was the first step in defining the community's vision for reuse of the site. In January 2012, the City adopted the Area Plan as part of Concord's 2030 General Plan, which sets forth the vision, policies, and standards for transformation of the Inland Area of the CNWS and immediately contiguous areas as envisioned by the Reuse Plan. Complete neighborhoods, extensive additions to protected open space in the region, creek restoration, new job centers, and a full spectrum of community facilities will be built on the site.

The Area Plan describes City (or City-authorized) development that will take place on land transferred to the City. In addition, in accordance with the Area Plan, the EBRPD will own and manage approximately 2,516 acres of the Reuse Area that will be transferred to the EBRPD. The EBRPD and the City will conserve this land (as described in more detail in the "Conservation Measures" section below) to partially offset the impacts of development by, or authorized by, the City. The approximately 2,516 acres will also serve as the Concord Hills Regional Park and provide open space and passive recreational uses.

The Area Plan also includes policies intended to permanently improve and protect the ecological values of the "Mt. Diablo Creek Riparian Corridor" shown on Figure 1. The City will own the Mt. Diablo Creek Riparian Corridor and will restore it to improve the creek's ecological and flood control values consistent with the Area Plan policies.

The City and EBRPD will take subsequent planning actions to effectuate the Area Plan. The primary future planning actions include the EBRPD's adoption of a regional park land use plan (Concord Hills Regional Park Land Use Plan) and the City's adoption and approval of specific plans and development applications. The Concord Hills Regional Park Land Use Plan is the EBRPD's planning document that will facilitate development of plans for park facilities, communicate park plans to the public, and allow for public comment. Development of the Land Use Plan is considered a public review process and a final Land Use Plan will be adopted by the EBRPD Board of Directors.

The implementation of the Area Plan also will require a 404 permit from the Corps because there are jurisdictional features present in widely dispersed locations throughout the CNWS Reuse Area. Under the Area Plan, the fill of jurisdictional features will occur in connection with the placement of fill, construction of crossings, drainage alterations, other construction activities, and habitat enhancements, thus necessitating a 404 permit from the Corps. To facilitate implementation of the Area Plan, the City applied to the Corps for a single individual permit that authorizes fill throughout the CNWS Reuse Area in connection with both development and conservation actions.

Project Components

The components of the proposed action are summarized below and then described in more detail in the following sections:

1. Navy transfer of approximately 4,972 acres of surplus property at the former CNWS (see Figure 1 for conveyance areas described below):

    a. Economic Development Conveyance (EDC) of an approximately 2,380-acre portion of the Inland Area of the former CNWS (EDC Area) to the City (see Table 2 for schedule).

    b. Public Benefit Conveyance (PBC) of an approximately 2,516-acre portion of the Inland Area of the former CNWS to the EBRPD (EBRPD PBC Area) through the Department of Interior (DOI)-National Park Service (NPS) (see Table 3 for schedule). For this PBC, the Navy plans to assign property to the DOI-NPS, which would then transfer property by deed(s) to the EBRPD.

    c. Public Benefit Conveyance of an approximately 76-acre portion of the Inland Area of the former CNWS to the Contra Costa County Sheriff's Department and the Contra Costa County Fire Protection District (County PBC) (see Table 3 for schedule). The Department of Justice has already approved the County PBC request and the Navy plans to issue the deed(s) to Contra Costa County.

2. Corps issuance of a 404 permit authorizing the fill of jurisdictional waters in connection with development and conservation actions.

3. Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) remediation on portions of the approximately 531-acre Installation Restoration (IR) Site 22, located within the EDC, which will subsequently be subject to implementation of the Area Plan as part of the City and City-authorized or approved development. The CERCLA response action for this site may be closely coordinated or integrated with the City or City-authorized development activities.

4. Implementation of the Concord Reuse Project Area Plan

    a. City and City-authorized or approved development and conservation activities and uses within the Reuse Area, including:

        i. New development and land uses by the City or others through City-issued approvals on the approximately 2,458-acre City Property shown on Figure 1 (includes the 2,380-acre EDC Area, 68-acre City-owned portion of the golf course, and 10 acres where road improvements related to the Area Plan will be performed within or contiguous to the EDC Area).
        ii. Riparian, wetland, and aquatic habitat enhancement, creation, restoration, and long-term management associated with the Mt. Diablo Creek Riparian Corridor (see Figure 1) and mitigation wetlands (see Figure 3) within the EDC Area.[1]

[1] The City will restore the Mt. Diablo Creek Riparian Corridor (Figure 1) in accordance with the Area Plan policies discussed above. The City also will preserve, enhance, and/or restore wetlands within the EDC Area (Figure 3) in accordance with Area Plan policies intended to protect existing wetland features. These activities also will likely be included in the 404 permit and permits issued by the Regional Water Quality Control Board and California Department of Fish and Wildlife.

iii. Provision of greenways, parks, and conservation open space, including implementation of enhancement and restoration on the EBRPD PBC Area summarized below.

b. EBRPD reuse, development, and operation of Concord Hills Regional Park including recreational and educational facilities and long-term management activities within the EBRPD PBC Area, including:

i. Reuse of some existing roads, rail lines, buildings, and other facilities for recreational and educational purposes and development and operation of new recreational and educational facilities.
ii. Long-term maintenance and management of the EBRPD PBC Area for passive recreation use consistent with conservation of biological resources.
iii. Restoration of some existing facilities, infrastructure, and other developed sites (e.g., roads, rail lines, and other infrastructure) and long-term maintenance and management of those areas for species habitat purposes.

c. Construction and operation of a 76-acre Contra Costa County Sheriff/Fire training and command center on the County PBC.

d. BART redevelopment of its currently developed 24-acre parcel.

Navy Transfer of the Former Concord Naval Weapons Station

The Navy's proposed federal action is the transfer of approximately 4,972 acres of the Inland Area of the former NWS Concord for reuse in a manner consistent with the Area Plan. The Navy's federal action will be implemented by three distinct property conveyances: (1) Navy conveyance of approximately 2,380 acres of property to the City for the purpose of economic development (EDC); (2) Navy assignment of approximately 2,516 acres of the property to the DOI-NPS, followed by a Public Benefit Conveyance of this land from DOI to the EBRPD (EBRPD PBC); and (3) Navy conveyance of 76 acres of surplus property to the Contra Costa County Sheriff's Department and the Contra Costa County Fire Protection District (County PBC) (Figure 1). The Navy's transfer of surplus property will occur in phases between approximately 2018 and 2026 as property becomes environmentally suitable for transfer.

The Navy expects to begin conveying land to the City and to assign the initial EBRPD PBC parcel to the DOI in 2018, and the City may begin developing the EDC Phase 1 in 2018. The DOI-NPS will convey the EBRPD PBC Area to the EBRPD in 2018 and the Navy will convey the County PBC in or about 2018. The remaining parcels within the EDC are anticipated to be conveyed by 2026. The timing of conveyances will depend on when CERCLA response actions (described below) are completed and whether the Navy and City agree to one or more early parcel transfers. See Tables 2 and 3 for the estimated schedule of conveyances and Figure 4 for locations.

Prior to deed transfer or assignment, the Navy may also enter into one or more Leases in Furtherance of Conveyance (LIFOCs), leases, licenses, or other appropriate real estate agreements with the City, EBRPD, or Contra Costa County, that allow those agencies to use the Navy's property for actions including, but not limited to, pre-engineering activities (described below), events, tours, and interim property management. Any real estate agreement issued by the Navy will conform to the conservation measures within this Biological Opinion and will require the property user to comply with this Biological Opinion.

Table 2. Preliminary* Proposed Transfer Phasing and Projected Transfer Dates for Economic Development Conveyance Parcels[2]

Parcel Name** (Figure 4)	Approximate Acreage	Year of Conveyance	Recipient	Mechanism
EDC Initial Transfer Parcel	1,233	2018	City of Concord	EDC: Navy issues Quitclaim Deed (QCD)
Portion of IR-22A (Group 2)	47	2018	City of Concord	EDC / QCD
Former Inland Burn Area	60	2019	City of Concord	EDC / QCD
Site 24A	12	2020	City of Concord	EDC / QCD
Runway Area	252	2021	City of Concord	EDC / QCD
Site 22**	744	2022	City of Concord	EDC / QCD
IR Site 29	27	2024	City of Concord	EDC / QCD
Guam Way	5	2026	City of Concord	EDC / QCD
Total	**2,380**		**City of Concord**	**EDC/QCD**

* Acreages and boundaries will not be final until EDC legal descriptions and associated documentation are complete.
** Many transfer parcels are named for the CERCLA sites they contain; however, parcels typically include a buffer around the CERCLA site boundaries and therefore transfer parcels are typically larger than the actual CERCLA sites for which they are named. For example, the parcel named Site 22 is 744 acres, but IR Site 22 is only 531 acres in size.

[2] The property transfer acreages and schedules described in Table 2 are estimates, based on when property likely will be suitable for transfer to the City with a quitclaim deed. Property transfers may occur sooner than this schedule through one or more early transfer actions. An early transfer may entail transfer in fee to the City followed by environmental clean-up if the Navy finds the property is suitable for an early transfer. One or more LIFOCs, leases, licenses, or other real estate agreements between the Navy and City may allow the City to use the Navy's property prior to conveying the fee interest to the City.

Table 3. Preliminary* Proposed Transfer Phasing and Projected Transfer Dates for Public Benefit Conveyance Parcels[3]

Parcel Name (Figure 4)	Approximate Acreage	Year of Conveyance	Recipient	Mechanism	Within EBRPD PBC Area
EBRPD PBC Area (Initial Transfer Parcel)	2,315	2018	EBRPD	PBC: Navy Assignment Letter to DOI-NPS / DOI-NPS issues QCD	Yes
Rocket Practice Area	51	2018	EBRPD	PBC / DOI issues QCD	Yes
Portion of IR-22A (Group 2)	76	2018	EBRPD	PBC / DOI issues QCD	Yes
County PBC Transfer	76	2018	Contra Costa County Sheriff's	PBC: Navy issues	No
IA-100 (PBC)	9	2019	EBRPD	PBC / DOI issues QCD	Yes
IA-100 West	15	2019	EBRPD	PBC / DOI issues QCD	Yes
Bermed Area/UXO 12	22	2020	EBRPD	PBC / DOI issues QCD	Yes
Eagles Nest/ UXO 10	6	2021	EBRPD	PBC / DOI issues QCD	Yes
Building 81/Site 42	22	2024	EBRPD	PBC / DOI issues QCD	Yes
Total	2,592				

* Acreages and boundaries will not be final until PBC legal descriptions and associated documentation are complete.
** Many transfer parcels are named for the CERCLA sites they contain; however, parcels typically include a buffer around the CERCLA site boundaries and therefore transfer parcels are typically larger than the actual CERCLA sites for which they are named.

Navy CERCLA actions

The Navy has been implementing and will continue to implement a hazardous materials investigation and remediation program in the Reuse Area. Potential effects on federally listed species that may result from the Navy's hazardous materials investigation and remediation activities in the CNWS Reuse Area were addressed by a previous Biological Opinion (Biological Opinion for the Environmental Investigations on the Former Naval Weapons Station Seal Beach, Detachment Concord, Concord, Contra Costa County, California; Service #81420-2011-F-0313) that was issued

[3] The property transfer acreages and schedules described in Table 3 are estimates, based on when property likely will be suitable for assignment to EBRPD and the County. One or more LIFOCs, leases, licenses, or other real estate agreements between the Navy and EBRPD or Navy and County that allows for property use prior to assignment may also occur.

to the Navy on August 31, 2012, and amended on June 23, 2013. The Navy will continue to coordinate the planning and implementation of its hazardous materials investigation and remediation program with the Service and if necessary will request an amendment to Biological Opinion #81420-2011-F-0313 to address additional CERCLA projects which may include additional ground disturbing work within the EDC Area (but not within the EBRPD PBC Area except for within parcels identified as "EBRPD-PBC Parcels for Later Transfer" in Figure 4). However, IR Site 22 (shown on Figure 4) CERCLA program activities are included in the Proposed Action addressed in this Biological Opinion because IR Site 22 CERCLA program activities may be closely coordinated, or integrated, with implementation of the Concord Reuse Project Area Plan and City or City-authorized development within the Reuse Area. Coordinating development related activities, such as grading IR Site 22 or demolition of bunkers with the remediation would reduce overall site disturbance and avoid a duplication of effort.

The Navy will prepare a CERCLA Amended Feasibility Study, and remediation alternatives to determine how to address arsenic in the soil at IR Site 22. Alternatives may include the following:

1. Land Use Controls (LUCs). Legal and administrative mechanisms to restrict site access to authorized personnel, limit exposure of users of the property to hazardous substances, and protect and maintain the integrity of the remedial action.

2. Excavation and on-site containment. Involves the excavation of contaminated surface soil and consolidation into an on-site engineered containment cell or corrective action management unit (CAMU). The CAMU may include a geosynthetic liner and a compacted soil cover. Hauling of the soil from various areas within IR Site 22 to the CAMU would be required with staging of soil piles for the construction of the CAMU. The CAMU would be located within the EDC Area and could potentially be located as indicated on Figure 4. A CAMU would require LUCs and long-term maintenance to maintain its effectiveness.

3. Excavation and disposal at an off-station treatment/disposal facility. Involves the excavation of contaminated surface soil and disposal at an off-site permitted disposal facility. Off-site disposal would require haul routes from IR Site 22 to the exit of the base. No LUCs would be required after this action is completed.

4. Excavation and selective capping. In conjunction with development, this would involve selective excavation of soil in areas proposed for residential reuse that will not contain buildings, parking lots, roads, or other means of beneficial capping, and consolidation of excavated soil within areas proposed for residential reuse that will contain buildings, parking lots, roads, or other means of beneficial capping.

U.S. Army Corps of Engineers Section 404 Permit Issuance

Pursuant to Section 404 of the Clean Water Act, the Corps is expected to issue a permit for the fill of jurisdictional wetlands and other waters of the U.S. during development-related and conservation-related activities pursuant to the Area Plan. These activities will fill approximately 6.93 acres of wetlands and other waters distributed throughout the Reuse Area. Impacts to jurisdictional wetlands and other waters will occur primarily during construction of the infrastructure within the EDC Area necessary to implement the Area Plan and during creek restoration activities within the Mt. Diablo Creek Riparian Corridor, but impacts will also include fill for conservation activities such as new pond creation and enhancement of existing ponds within the EBRPD PBC Area. The City submitted a Section 404 permit application to the Corps on November 16, 2012 for implementation

of the Area Plan and provided supplemental information on December 10, 2015. The Corps is expected to act on this application upon completion of its review, formal consultation, and environmental compliance procedures.

Implementation of the Concord Reuse Project Area Plan

The Area Plan was a result of the BRAC reuse planning process the City conducted as the LRA and the Area Plan is now part of the Concord 2030 General Plan. The Area Plan designates the land uses and establishes the land use policies that will apply to conservation and development within the CNWS Reuse Area during the decades to come. The Area Plan land use diagram is shown in Figure 1, and the approximate total acreages of land uses by type are provided in Table 4.

Table 4. Approximate Acreages of Proposed Land Uses in the Reuse Area

Land Uses (Figure 1)	**Area (acres)**
Mt. Diablo Creek Riparian Corridor	189
EBRPD PBC Area	2,516
City Conservation Lands	19
Transit-oriented development (TOD) Core*	55
TOD Neighborhoods	82
Central Neighborhoods	189
Village Centers	65
Village Neighborhoods	796
Commercial Flex	194
Campus	124
First Responder Training Center**	84
City Parks***	335
Greenways	407
Trails	9
Additional Off-Site Roads	10
Total	**5,074**

* Includes the BART parcel

** Includes the 76-acre County PBC and adjacent portion of Evora Road

*** Includes the golf course

The Area Plan specifies complete neighborhoods, extensive additions to protected open space including a regional park (the Concord Hills Regional Park within the EBRPD PBC Area), new job centers, sports facilities, and a full spectrum of community facilities and urban infrastructure, including new roads, creek crossings, public infrastructure such as stormwater detention facilities, PG&E substations, a sports tournament facility, public parks, and creek restoration with improved flood control. The Area Plan focuses on a series of villages connected by transit, allowing for a significant, new, diverse development balance while maintaining more than half of the site (nearly 3,500 acres) as parks, recreation, and open space, including passive recreation in the approximately 2,516-acre EBRPD PBC Area (Figure 1).

The Area Plan will accommodate various types of community facilities, such as a four-year university campus and a first responder center. Overall, the Area Plan provides new land use for a transit-oriented community to accommodate up to 12,272 residential units and 6.2 million square feet of

commercial and retail uses, and nearly 3,500 acres of recreation, open space, and conservation. Area Plan implementation will be phased over 35 years. The precise timing of new development will depend upon when the Navy is able to transfer land, when CERCLA response actions are completed, economic conditions, demographics, transportation, technology, regional lifestyles, real estate trends, and other factors.

Planning to date has been at the program level only, with areas subject to urban development, recreational uses, conservation, etc. defined in terms of location and type of use only, but precise building or roadway locations (i.e., specific types of residential or commercial buildings, and block layouts) have not been defined. The Area Plan is defined well enough to demonstrate the amount of disturbance that will occur on the EDC Area and County PBC Area, and future development will be subject to the Area Plan policies, which preclude urban development in the EBRPD PBC Area and require creek buffers and other environmental protection measures. Likewise, the Area Plan and the EBRPD's Concord Hills Regional Park Land Use Plan are sufficiently defined to evaluate the level of disturbance and overall enhancement within the EBRPD PBC Area.

The City and future EDC Area developers will conduct further geotechnical, hydrological, and soil investigations in the EDC Area to help inform the City's environmental review under the California Environmental Quality Act (CEQA) as it considers site-specific land use entitlements, and as the City evaluates opportunities for on-site wetland creation or enhancement. Such investigations will be needed to determine construction feasibility and to assess the environmental effects of subsequent development activities in accordance with CEQA. Pre-engineering investigations will be localized, temporary/short-duration, and minimally invasive. This pre-engineering investigative work may occur before the EDC property is conveyed to the City, or following transfer but before the City formally authorizes development.

City and City-Authorized or Approved Development, Operational, and Conservation Activities on the EDC Area (2,380 acres)

Residential and Transit-Oriented Land Uses

The City will focus the highest-intensity uses on the site around the North Concord/Martinez BART Station and within the cores of three villages along the western edge of the site, between Mt. Diablo Creek and the western site boundary, southeast of Willow Pass Road (Figure 1). The planned central neighborhood, three village centers, and associated village neighborhoods will include a combined 1,050 acres and 9,300 housing units. The villages will have a neighborhood district character similar to, but at slightly lower intensities/densities than, the North Concord/Martinez BART Station area. Within a half-mile of the North Concord/Martinez BART Station, a Transit-oriented Development (TOD) land use category, including approximately 137 acres and 2,900 housing units, will allow for a mix of uses including residential, office, retail, community facilities, and parks and recreation. BART will redevelop its 24-acre parcel, which is currently occupied entirely by parking lots, into transit-oriented development similar to the transit-oriented land uses on the EDC Area. Approximately 25 percent of the housing units will be in multi-unit buildings, 40 percent will be in attached single-unit buildings, 25 percent will be in mixed attached and detached single unit buildings, and 10 percent will be detached single units. Twenty-five percent of all housing units, both rental and ownership, will be made available at varying levels of affordability, and in accordance with BRAC regulations and binding legal agreements approved by the U.S. Department of Housing and Urban Development, 135 units of multi-family transitional housing will be provided to address homelessness.

Site development will include two areas of commercial/retail flex uses covering 194 acres, that will allow varying proportions of light industrial, retail, and office uses depending upon market demand.

Transportation

A high-capacity bus transit service will serve the site, connecting the North Concord/Martinez BART Station area to the villages and linking them to downtown Concord and existing neighborhoods. Transportation also will include on and off-street bicycle and pedestrian networks, reflecting the Area Plan, Contra Costa Countywide Bike and Pedestrian Plan, and Concord Trails Master Plan.

The roadway network includes limited crossings of Mt. Diablo Creek and limited roadway access into the neighborhoods to the west of the site. With the implementation of the Area Plan, the City will remove 14 existing Mt. Diablo Creek crossings and construct seven new road crossings: parallel to State Route 4 on the north side of the highway, below the State Route 4 overpass, between State Route 4 and Willow Pass Road, just upstream from Willow Pass Road, and connecting the southeastern portion of the development area to Bailey Road. In addition, two pedestrian bridges are proposed between Willow Pass and Bailey Roads. Each of the new crossings will be a clear-span bridge that avoids impacts within the creek channel and minimizes floodplain impacts. As a result, once the Area Plan is implemented, there will be fewer Mt. Diablo Creek crossings than currently exist, resulting in a net reduction of bridges and culverts along the creek.

The proposed action also includes road improvements within all rights of way within the CNWS Reuse Area plus some specific adjacent areas not currently owned by the Navy, but where the City will make road improvements to facilitate access to the CNWS Reuse Area. These areas include the Evora Road extension between Willow Pass Road and the CNWS Reuse Area boundary, the Willow Pass Road/State Route 4 interchange, and the Port Chicago Highway/State Route 4 interchange, in addition to widening of Willow Pass Road and Bailey Road (Figure 1). These road improvements, which will involve areas not currently owned by the Navy (i.e., within existing road rights of way) will disturb up to approximately 10 acres.

The Contra Costa Canal and Clayton Canal pass through the Reuse Area but are not owned by the Navy. They will not be part of any conveyance and are not incorporated into the Area Plan. However, some transportation and utility infrastructure included in the Area Plan will need to cross over (e.g., bridges) or under (e.g., utilities) the canals.

Community Facilities

The Area Plan will integrate communities through land use and transportation planning. In addition, the Area Plan seeks to serve the community with various community-serving uses and facilities, referred to collectively in this Biological Opinion as community facilities. The typical types of community facilities will include police, fire, and emergency response; libraries; schools (K–12), colleges/universities, and technical schools; community and cultural centers, performing arts centers and other municipal functions; and parks and greenways. Typical private and not-for-profit community facilities will include research and educational institutes; foundations or not-for-profit institutions; performing art centers; museums and cultural centers; Veterans' facilities; hospitals, clinics, and other medical facilities; senior care facilities; environmental education and interpretive centers; and places of worship. In addition, there will be an approximately 75-acre tournament sports facility located southeast of Willow Pass Road on the northeast side of Mt. Diablo Creek (Figure 1). The Area Plan identifies the types of community facilities that will be built and operated, but the specific mix of uses of these community facilities will be determined at the design stage.

Roughly half of the Diablo Creek Golf Course is currently owned by the City; the other half is currently owned by the Navy and will be conveyed to the City. The continued operation and maintenance of the golf course is included in the Area Plan. Such activities include operation of and play within the golf course, as well as continued vegetation management, management of the artificial ponds used for irrigation, and maintenance of existing structures, paths, golf cart bridges over Mt. Diablo Creek, and other infrastructure. Covered activities on the golf course will also include reconfiguration and minor construction, such as that associated with configuring holes after a new road facilitating access to the CNWS Reuse Area in the southern portion of the existing course is built.

The Area Plan identifies two locations for new Citywide Parks: an approximately 45-acre park along Olivera Road, and an approximately 100-acre Citywide Park adjacent to the tournament sports facility southeast of Willow Pass Road. The Area Plan also features a connected network of linear open spaces, or greenways. These greenways form part of the area's overall circulation network with integrated pedestrian and bicycle paths. They provide space for recreational amenities such as picnic areas, community gardens, and play fields. Among the trails proposed are a trail along the southwestern side of Mt. Diablo Creek, near the outer edge of an approximately 300-foot-wide Riparian Corridor, and another City trail along the northeastern side of Mt. Diablo creek along an existing railroad track that will connect to an EBRPD regional trail within its regional park (Figure 1).

EDC Infrastructure

In addition to the specific facilities and land-use elements described above, utility and stormwater infrastructure will be constructed. Stormwater detention facilities will include multiple, relatively small basins distributed throughout the development area. Such facilities will be designed to maintain dry conditions except for brief periods following storms. Stormwater outfalls to Mt. Diablo Creek are not envisioned, as on-site detention is proposed, but limited outfalls may be needed as detailed design progresses. Utility infrastructure will include water lines below Mt. Diablo Creek between water tanks on the northeast side of the creek and development areas (Figure 1). Other infrastructure (e.g., electrical and fiber optic lines) may also cross the creek, primarily attached to bridges or on overhead lines.

Riparian Corridor and Creek Restoration

The City Property will accommodate an approximately 189-acre Mt. Diablo Creek Riparian Corridor (Figure 1). The City or EDC Area developers will modify the Mt. Diablo Creek Riparian Corridor to stabilize eroding creek banks, facilitate flood conveyance, and improve habitat conditions through a variety of habitat restoration actions. Banks will be graded to widen the creek corridor to promote flood conveyance, stabilize the banks for geomorphic stability and public safety, and create more favorable habitat conditions. The majority of existing native riparian vegetation will be left in place as banks behind that vegetation are laid back to provide greater flood conveyance and additional planting area for up to 80 acres of riparian woodland, oak woodland, and oak savannah habitat. Habitat features such as coarse woody debris and floodplain depressions will be incorporated as well, and invasive plants within the Riparian Corridor will be removed. To prevent future channel incision and improve channel stability, approximately 20 buried grade control structures composed of boulders will be installed below existing grade and the channel will be restored following construction. Channel restoration will also occur where existing culverts are removed. The City will conduct long-term management and maintenance of the Riparian Corridor, Mt. Diablo Creek, and infrastructure within and crossing these features. Habitat management activities may include periodic removal or management of invasive plants, native tree and shrub planting, and modification or

addition of habitat features such as coarse woody debris or depressions. Flood management activities may include removal of fallen trees (if they cause excessive erosion or backup of water), remedial grading if erosion occurs, or other similar activities. Restoration designs and management and maintenance activities will be described in more detail in an approved Riparian Habitat Enhancement and Management Plan (see Conservation Measure 7 below).

Wetland Preservation/Creation

The City is proposing to avoid fill of some of the more extensive existing wetlands on the EDC Area, particularly near the former airfield. In addition, the area near the former airfield may be able to accommodate 10 or more acres of wetland restoration/creation, such as in the area indicated on Figure 3 or elsewhere south of the old airfield. The City proposes to create wetlands in the EDC Area to compensate for impacts to wetlands and the City anticipates the 404 permit or water quality certification issued by the Regional Water Quality Control Board may require wetland creation. The City or developers of the EDC Area may also create additional wetlands in the Mt. Diablo Creek floodplain, and may perform creek restoration or realignment, accompanied by wetland enhancement along portions of Willow Pass Creek. Any wetland creation in the Riparian Corridor will be described in the Riparian Habitat Enhancement and Management Plan (see Conservation Measure 7 below). The City or EDC Area developers will perform soils and hydrological investigations, which may involve borings and the installation of piezometers, to inform detailed wetland creation plans. Such activities may occur prior to land transfer or the start of construction-related activities.

Water Tanks and City Conservation Lands

The City will construct two water storage tanks, an 8,500,000-gallon domestic water tank and an 80,000-gallon recycled water tank (each 20 feet in height) and a pipeline on an approximately 27-acre portion of the EDC Area northeast of Mt. Diablo Creek, contiguous to the EBRPD PBC Area (Figure 1). Parking for tank access will be provided in the immediate vicinity of the water tanks. The water storage tanks will be connected to the EDC Area via two pipes that will be installed across Mt. Diablo Creek. The pipelines from the tanks to the development areas will be buried beneath the creek bed, and the bed will then be restored to natural conditions above the pipes. The total estimated permanent disturbance associated with the tanks is approximately 8 acres for the storage tanks and parking with an additional 8 acres of temporary disturbance during pipeline construction. Terrestrial habitats temporarily disturbed during pipeline construction will be restored to California annual grassland habitat.

After the water tanks and pipeline are built, the City will designate the 19 acres not permanently impacted for conservation purposes (hereafter "City Conservation Lands") (City Conservation Lands in Figure 1). The approximately 19-acre area designated as City Conservation Lands will be managed to provide grassland habitat suitable for use by wildlife consistent with upland conditions in the EBRPD PBC Area (see Conservation Measure 4 below). The EBRPD PBC Area and City Conservation Lands are referred to collectively in this Biological Opinion as the "On-site Conservation Lands."

County PBC for Sheriff/Fire Department Facility

The 76-acre County PBC Area north of State Route 4 will be conveyed to the Contra Costa County Sheriff's Department and the Contra Costa County Fire Protection District (Figure 1). This already developed site will be redeveloped as a first responder training and emergency command facility.

BART Parcel Redevelopment

BART will redevelop its 24-acre parcel, which is currently occupied entirely by parking lots, into transit-oriented development as described above in the section on transit-oriented land uses on the EDC Area.

City-Sponsored Habitat Enhancement on the EBRPD PBC

The Area Plan envisions City-sponsored resource enhancement, management, and preservation within the approximately 2,516-acre EBRPD PBC Area. Such conservation activities will include preserving, enhancing, and managing existing breeding and upland habitat for the Central California tiger salamander, California red-legged frog, and Alameda whipsnake, and creating new aquatic breeding habitat for the Central California tiger salamander and California red-legged frog that will increase local population sizes of these species and facilitate dispersal and gene exchange throughout the On-site Conservation Lands and between the On-site Conservation Lands and nearby areas. The City's habitat enhancement actions will be conducted according to an approved Habitat Mitigation and Monitoring Plan (HMMP) (see Conservation Measure 5 below).

City-Sponsored Off-Site Conservation

In addition to preserving and managing the On-site Conservation Lands as partial mitigation for the impacts of developing the EDC Area, the City (or future EDC Area developers) will also provide off-site habitat conservation. The off-site conservation will further offset the impacts of development of the EDC Area by, or authorized by, the City. The acreage of off-site habitat conservation will be sufficient to ensure that, in combination with the On-site Conservation Lands, total conservation lands compensate for impacts resulting from EDC-related development of currently undeveloped portions of the EDC Area south of State Route 4 at a 2:1 (conservation:impact) ratio (see Conservation Measure 6 below).

East Bay Regional Park District Concord Hills Regional Park

The 2,516-acre EBRPD PBC Area will comprise the Concord Hills Regional Park and will include the operation of approximately 30 acres of roads, 30 acres of trails, 13 acres of visitor serving amenities facilities (e.g., visitor center, educational signposts, restrooms, parking areas, picnic/camping areas), and 12 acres of operations facilities (e.g., corporation yard, staff offices, and native plant nursery) totaling 85 acres of park uses. Of these 85 acres, approximately 68.5 acres will occur within existing developed sites (building sites, paved and unpaved roads, parking areas, bunkers, and railroad tracks) from the Navy's operation of the property. An additional approximately 16.5 acres of new development will occur from implementation of the Concord Hills Regional Park Land Use Plan. The EBRPD PBC Area currently includes existing roads, rails, and other developed sites that are not proposed for use under the Concord Hills Regional Park Land Use Plan and will be planned and available for restoration and management within the On-site Conservation Lands. It is an objective of the EBRPD's Land Use Plan to restore or reuse as much of the existing roads, rails, and other developed sites within the PBC Area as feasible and as funding becomes available.

The EBRPD PBC Area includes known and potential breeding habitat for Central California tiger salamanders and California red-legged frogs, and the majority of high-quality habitat for these species within the Reuse Area is located within the On-site Conservation Lands. The On-site Conservation Lands will be preserved and managed as habitat for Central California tiger salamander, California red-legged frog, and Alameda whipsnake according to an approved Long Term Management Plan (see Conservation Measure 4), enhanced according to an approved HMMP

(see Conservation Measure 5), and restored as described in Conservation Measure 8i. Collectively, these areas encompass approximately 2,535 acres. Table 5 provides the approximate acreage of existing habitat types within these On-site Conservation Lands and the habitat types are shown on Figure 2.

Table 5. Approximate Acreages of Existing Habitat Types on On-Site Conservation Lands

Habitat Type (Figure 2)	Area (acres)
California Annual Grassland	2,263
Coyote Brush Scrub/Coastal Sage Scrub	0.2
Developed*	120
Oak Woodland/Savannah	99
Orchards and Plantations	37
Riparian Woodland	1
Freshwater Marsh	5
Seasonal Wetlands	5
Creeks, Drainages, and Ponds	5
Total	**2,535**

* Includes buildings, roads, parking areas, railroad tracks, and bunkers

The EBRPD is preparing the Concord Hills Regional Park Land Use Plan that will accommodate conservation, passive recreation, environmental education, and park operations facilities. Additionally, the Concord Hills Regional Park Land Use Plan identifies a visitors center that will be operated jointly with the National Park Service to highlight the history of the Port Chicago Naval Magazine National Memorial which is located offsite and currently inaccessible to the public. The EBRPD plans to adopt the Concord Hills Regional Park Land Use Plan in 2017. The initial phase of regional park development will begin upon transfer to EBRPD and will occur in the area southeast of Bailey Road. Initial work will focus on development of staging areas for park visitors and conversion of existing roads and rail lines into a passive recreational trail system. Subsequent phases are expected to include the development of the visitor's center area and development of a linear trail between Bailey Road and Willow Pass Road (Figure 5).

In addition to managing the Concord Hills Regional Park for recreational uses, the EBRPD will manage the park in perpetuity for the protection and benefit of special-status species according to an approved Long Term Management Plan (see Conservation Measure 4 below). The EBRPD is a special district with the primary mission of protecting natural and cultural resources in balance with passive recreation and environmental education. The EBRPD is equipped with professional land stewards, rangers, and public safety employees trained specifically to manage public access and open space lands for the benefit of species. The EBRPD is authorized to enforce any park rules through its Ordinance 38. The Concord Hills Regional Park Land Use Plan will identify specific management prescriptions that will ensure that public access will be permitted in a manner that is consistent with species protection.

The regional park will include two use zones: Conservation Zone 1, where park uses will be limited to passive recreational trails and Conservation Zone 2, where limited park facilities will be developed

(Figures 5 and 6). Conservation Zone 1 is the zone where the primary focus is conservation and management of natural resources. Public access will be limited to passive recreation trails that will be fenced where necessary to prevent unauthorized access to breeding ponds and other sensitive habitats. Trail use will include on-trail hiking, non-motorized bicycle riding, walking, horseback riding, wildlife observation and photography, and environmental education and interpretive displays sited in accordance with the siting guidelines described in Conservation Measure 8 below. No off trail access, developed recreation facilities, or vehicle access (except to accommodate resource conservation) will be allowed in the approximately 2,390-acre Conservation Zone 1. Conservation Zone 1 includes buffer zones (where there will be no recreational uses or facilities) of a minimum of 500 feet around the most highly sensitive habitat areas, including all Central California tiger salamander and California red-legged frog breeding habitat, and a 500-foot buffer zone around two existing patches of coastal sage scrub located in the upper part of Rattlesnake Canyon (the highest-quality potential Alameda whipsnake habitat on the site). Recreational uses will be controlled using a variety of techniques including fences, gates, clearly signed trails, educational kiosks, trail maps and brochures, ranger and police patrols, and interpretive programs. Trails will be established primarily on existing roads and rail lines which will minimize the need for new ground-disturbing activities. Multi-use trails will generally be 10 feet wide with 2-foot shoulders, and single-use trails will be no more than 8 feet wide. Trail access will be limited to the hours between sunrise and sundown.

Within Conservation Zone 1, up to 620 acres (see Resource Protection Zones on Figures 5 and 6) will be managed solely for resource protection and no public access or trail use will be permitted. These Resource Protection Zones will protect the areas of Rattlesnake Canyon, the Hilltop Ponds, Cistern Pond, and Indian Springs. An area of approximately 400 acres will be reserved as a Resource Protection Zone around Rattlesnake Canyon. An area of about 35 acres will be reserved as a Resource Protection Zone around Cistern Pond. An area of approximately 185 acres will be reserved as a Resource Protection Zone around the Hilltop Ponds, Eagles Nest site, and Indian Springs (Figures 6 and 8).

Conservation Zone 2 is an approximately 126-acre zone in which approximately 35 acres of recreation and park facilities will be permitted in accordance with the siting guidelines described in Conservation Measure 8 below. Within the 91 acres of Conservation Zone 2 that do not contain recreational and park facilities, public access will be limited to passive recreation trails and land will be managed for conservation consistent with Conservation Zone 1. The intent of Conservation Zone 2 is to limit the area in which park facilities could be located, while providing necessary flexibility to allow for design development. Of the 35 acres to be developed, approximately 25 acres will overlap with existing developed sites while 10 acres of new development will occur.

Park facilities proposed in this zone will be limited to hiking overlooks consisting of park benches at key vistas, picnic areas located within existing developed magazines, group picnic facilities along the primary park access road, hike-in picnic areas, reuse of existing developed magazines for interpretive displays and park programming, a backcountry campsite, and a hike-in group campsite.

The 35 acres of development within Conservation Zone 2 will also include a visitors and interpretation center conveying the history of the Port Chicago Naval Magazine National Memorial as well as the natural and cultural history of the property and surrounding region. Additionally, Conservation Zone 2 will include park operations and support facilities necessary to support park operations and stewardship. The park operations and support facility will provide office and storage space for staff and equipment necessary for park operations, land management, and stewardship activities. A public safety office providing for park patrol and wildland fire response to support the

park and other lands conserved throughout the region will be constructed within the park operations and support facility. An approximately 5-acre native plant nursery will also be established to support land restoration efforts.

Table 6 summarizes the approximate extent of proposed Regional Park activities and conservation zones.

Table 6. Summary of Proposed Regional Park Activities.

Regional Park Acreage (All Zones- 2,516 Acres)	Miles	Acres	Acres on Existing Developed Sites	Acres New Development
Area restricted from park use		**2,430.4**	*NA*	*NA*
Park uses (including roads, trails, and facilities)		**85.6**	**69**	**16.5**

Conservation Zone 2 Total Acres		**126.0**		

Proposed Conservation Measures

The following Conservation Measures are part of the proposed action to minimize and mitigate its potential effects on listed species and their habitat.

1. *Conditions of Transfer.*

a. The Navy shall require as a condition of transfer or lease, to be memorialized in the appropriate real estate agreement (such as an EDC Memorandum of Agreement between the Navy and the City), that the initial transfer of the EBRPD PBC Area from the DOI-NPS to the EBRPD is completed prior to the start of demolition or construction within the EDC Area related to implementation of the Area Plan.[4]

b. The Navy shall not assign the EBRPD PBC Area property to the DOI-NPS until Navy has received notice from the Service that a draft conservation easement or other legal mechanism for the preservation of the EBRPD PBC Area (measure 4(a) and a Long Term Management Plan for the EBRPD PBC Area and City Conservation Lands (measure 4(c) have been approved by the Service, and that the City has provided the Service with a draft Property Analysis Record (PAR) or PAR-like analysis for the long term management and monitoring actions required by the Long Term Management Plan, a description of the funding mechanism, and a funding schedule in accordance with measure 4(d).

2. Interim Land Management.

a. *Navy*: During Navy ownership of property, Navy shall (with the exception of remediation activities in select areas that are covered by a separate Biological Opinion or by additional coordination with the Service) manage the Reuse Area to maintain or improve habitat conditions for listed species. This will include:

i. Maintenance of appropriate grass heights for listed species via grazing within the On-site Conservation Lands;
ii. Controlling noxious weed infestations;
iii. Controlling access to the property and preventing trespass and vandalism;
iv. Conducting maintenance or repairs necessary to prevent degradation of upland or aquatic habitat (i.e., erosion control, fencing repair, bank/berm repair).

b. *City*: During the City's ownership of the EDC Area (or any portion of the EDC Area) prior to development activities, the City shall manage the EDC Area to avoid habitat degradation in areas such as the Mt. Diablo Creek Riparian Corridor that will be subject to only limited development and to avoid habitat degradation in the On-site Conservation Areas. Preventing habitat degradation in the Mt. Diablo Creek Riparian Corridor and On-Site Conservation Areas may require the following management actions (i.e. weed/vegetation control, erosion control, etc.) within the Mt. Diablo Creek Riparian Corridor, the City Conservation Lands, and the EDC areas adjoining or near these areas. This management will include:

i. Controlling noxious weed infestations.

[4] The pre-engineering activities defined in the Proposed Action, and ground disturbance associated with CERCLA remediation work, grazing, or that is necessary to repair and operate existing utility infrastructure, may proceed prior to completing the EBRPD PBC Area initial transfer.

ii. Controlling access to the property owned by the City and preventing trespass and vandalism.
iii. Conducting maintenance or repairs necessary to prevent degradation of upland or aquatic habitat (i.e., erosion control, fencing repair, bank/berm repair).

c. *EBRPD*: During EBRPD ownership of property, EBRPD will provide interim management of the property in accordance with a Service-approved Interim Management Plan that will be included in the Long Term Management Plan (see Conservation Measure 4(c) below). Interim management may commence prior to transfer to EBRPD if the DOI-NPS holds title for an extended period of time and the Navy, DOI-NPS, and EBRPD institute a mechanism to facilitate early interim management.

3. *City Implementation and Oversight of the Conservation Measures.*

The LRA will be the City agency responsible for ensuring the City and future developers of City-authorized projects comply with the Conservation Measures contained in this Biological Opinion that apply to the development of the City Property, including the on-site and off-site compensatory mitigation measures. The LRA will also monitor the EBRPD's preservation and management of the On-site Conservation Lands for compliance with the Biological Opinion. Specifically, the LRA will be responsible for Conservation Measures 2(b), 7, 10, 12, 13 (pre-development and post-development minimization measures), Conservation Measures 1(b), 4, 5, 6 (on-site and off-site compensatory mitigation measures for the effects of City-sponsored or authorized development),[5] and Conservation Measure 11 (annual reporting to the Service documenting the City's ongoing compliance with the Biological Opinion). In addition, the LRA will implement, and require future developers to implement, Conservation Measure 9 (construction-related measures that will avoid or minimize effects to listed species during the development of the City Property).

To ensure long term compliance with the Conservation Measures, demonstrate ongoing compliance, and facilitate the Service's oversight of compliance, the City will implement the following actions:

a. In accordance with State law, the City Council will adopt one or more specific plans for the City Property. All adopted specific plans will be incorporated into the City's general plan through a general plan amendment, and all subsequent City entitlements will be consistent with the specific and general plans. The City will include the avoidance and minimization measures contained in Conservation Measures 9, 10, 12, and 13 in all of the specific plan documents for the City Property, making these Conservation Measures part of the City's general plan and ensuring they are enforceable conditions of all future entitlements.

b. The City will establish development fees to pay for the City's implementation of the Biological Opinion. The City, through the LRA, will also provide funding as needed to implement the Biological Opinion. The development fees will be paid when the LRA transfers property to the party developing it, will require all developers to pay a pro rata share of the costs, and will include fees to reimburse the LRA.

[5] The City's responsibilities for implementing the Long Term Management Plan for the On-site Conservation Lands (Conservation Measures 1(b), 4(c), HMMP (Conservation Measure 5), Riparian Habitat Enhancement and Management Plan (Conservation Measure 7), off-site habitat long term management plan (Conservation Measure 6(c)(iii)), and the funding plans for the on-site and off-site mitigation plans (Conservation Measures 4(d), 6(d)) will be addressed in those documents, and any responsibilities required under those plans will supersede any conflicting measures contained in Conservation Measure 3.

c. The City Council, sitting as the LRA, will adopt a resolution directing the Executive Director for the LRA (the "Executive Director") to: (1) put all procedures in place needed to ensure the LRA, and all City-authorized development, adhere to the Service's Biological Opinion; (2) collect development fees to pay for the City's implementation of the Biological Opinion; (3) design and implement a project controls system to track compliance with the Biological Opinion; and (4) report the City's compliance to the Service. This resolution will provide the Executive Director (and his or her designees) with the following authority:

i. The Executive Director will oversee interim management of the EDC Area in accordance with Conservation Measure 2(b).
ii. The Executive Director will be responsible for coordinating the preparation, and Service approval, of the Long Term Management Plan, draft PAR, and draft funding mechanism and schedule for the On-site Conservation Lands with the EBRPD (Conservation Measures 1(b), 4(c), 4(d).
iii. The Executive Director will be responsible for preparing the final funding plan for the On-site Conservation Lands Long Term Management Plan and securing the Service's approval of the final funding plan in accordance with Conservation Measure 4(d).
iv. The Executive Director will be responsible for recording the Service-approved City Conservation Lands conservation easement deed in accordance with Conservation Measure 4(b), coordinating the off-site habitat conservation with the Service in accordance with Conservation Measure 6, and ensuring the off-site habitat conservation is implemented.
v. The Executive Director will be responsible for preparing and securing the Service's approval of the HMMP and Riparian Habitat Enhancement and Management Plan (and all associated PAR analysis and funding mechanisms) in accordance with Conservation Measures 5 and 7.
vi. The Executive Director will collect development fees and use those fees, and other funds from the City and LRA, to fund the On-site Conservation Lands Long Term Management Plan (Conservation Measure 4(d), HMMP (Conservation Measure 5), off-site compensatory mitigation (Conservation Measure 6), and the Riparian Habitat Enhancement and Management Plan (Conservation Measure 7). Through the project controls system, described in Conservation Measure 3(c) above, the Executive Director will track the development fees and other funds the LRA collects, the EDC Area development requiring compensatory mitigation, the amount and location of all compensatory mitigation the City has provided, and any on-site or off-site mitigation that is available for future development phases (Conservation Measure 11(b)).
vii. All City-issued entitlements will include quarterly and annual reporting conditions to facilitate the City's oversight and enforcement of the construction and post-construction avoidance and minimization measures required by Conservation Measures 9, 10, 12, and 13. The Executive Director will review the quarterly and annual reports for compliance, require corrective action as necessary for compliance, and track compliance through the project controls system described in Conservation Measure 3(c) above.
viii. Every year beginning after the first full year following the EBRPD PBC Area Initial Transfer described in Table 3 of the Biological Opinion, the Executive Director will inspect the EBRPD PBC Area for compliance with Conservation Measures 2(c), 4(e), 8(e)-(h), 8(j), 8(n) and the Service-approved conservation easement deeds or other Service-approved legal mechanisms described in Conservation Measures 4(a) and 4(b).

ix. Every year beginning after the first full year following the Navy's conveyance of the EDC Initial Transfer to the City, the Executive Director will submit an "Annual Report" to the Service on behalf of the City in accordance with Conservation Measure 11.

4. *Long-Term Preservation and Management of the EBRPD PBC Area and City Conservation Lands.*

EBRPD and the City shall assure preservation and management of the On-site Conservation Lands as follows:

a. Following conveyance of the initial EBRPD PBC transfer parcel, the EBRPD will record a Service-approved conservation easement or other Service-approved legal mechanism over the initial EBRPD PBC transfer parcel, which instrument shall specify allowable uses within the EBRPD PBC transfer parcel and the restrictions and obligations that apply to those areas devoted to conservation (Table 6) and managed pursuant to the Long Term Management Plan (measure 4(a)(iii)). The EBRPD (or City) will provide the Service with a copy of the recorded document prior to commencement of ground disturbing activities within either the EBRPD PBC Area or EDC Area.

b. Following conveyance of the City Conservation Lands, the City will record a Service-approved conservation easement or other Service-approved legal mechanism over the City Conservation Lands within 60 days following the completion of the water storage tanks and related improvements.

c. The City, in coordination with the EBRPD, will develop a Long Term Management Plan describing the measures that will be taken to manage the On-site Conservation Lands and to monitor the effects of management on the Central California tiger salamander and California red-legged frog. This Long Term Management Plan must be submitted to and approved by the Service prior to the initial transfer of the EBRPD PBC Area. The EBRPD will implement the Long Term Management Plan. Monitoring described in the Long Term Management Plan will serve to ensure compliance with the terms and conditions of the Biological Opinion, gauge the effect and effectiveness of management activities, and inform an adaptive management strategy. The Long Term Management Plan will include:

i. A description of the location and boundaries of the EBRPD PBC Area and City Conservation Lands and description of existing site conditions.
ii. A description of facilities to be developed within the EBRPD PBC Area and City Conservation Lands and a description of planned recreational use within these areas.
iii. An Interim Management Plan describing how the EBRPD PBC will be managed following conveyance to EBRPD but before full funding and implementation of the Long Term Management Plan, and a schedule for transitioning from interim management to implementation of the Long Term Management Plan.
iv. A description of measures that will be taken to protect particularly sensitive resources, such as maintenance of pond berms and water control structures, bullfrog (*Lithobates catesbeianus*) management, and sedimentation, erosion, and vegetation encroachment at breeding ponds for Central California tiger salamanders and California red-legged frogs.
v. Avoidance and Minimization Measures (AMMs) to address any construction-related impacts associated with park development, with operations and maintenance activities, and with creation, restoration, or maintenance of habitat for Central California tiger salamanders and California red-legged frogs.

vi. A description of maintenance and management activities, including regular maintenance (e.g., of fencing) and less frequent, longer-term maintenance (e.g., maintenance of ponds and berms to ensure long-term functionality as breeding habitat).

vii. A description of grazing management, including approximate stocking levels, target Residual Dry Matter (RDM) levels, and an adaptive management approach.

viii. A description of habitat and species monitoring measures in the EBRPD PBC Area and City Conservation Lands, including specific, objective performance criteria; monitoring methods (e.g., RDM surveys, livestock use records); data analysis; reporting requirements; monitoring schedule; an adaptive management approach based on monitoring; etc.

ix. A description of dog management measures that will identify areas suitable for dog access and conditions on use, as well as areas where no dogs will be permitted.

x. A contingency plan for elements that do not meet performance criteria. This plan shall include specific triggers for remediation if performance criteria are not being met and a description of the process by which problems (e.g., presence of non-native predators and competitors) will be remediated.

xi. A description of the relative roles and responsibilities of the City and EBRPD in managing, maintaining, and monitoring the EBRPD PBC Area and City Conservation Lands. For example, the City will be responsible for providing funding that the EBRPD will use to perform the management, maintenance, monitoring, and reporting activities that are necessary for the conservation of listed species and their habitats within the EBRPD PBC Area and City Conservation Lands in accordance with the City's mitigation requirements for impacts from EDC Area-related development. The EBRPD will be responsible for performing those activities and for funding and implementing (i) mitigation for EBRPD's development of the EBRPD PBC Area for park purposes, and (ii) avoidance, minimization, and management arising from passive recreation, interpretive or educational use, and other regional park activities under the EBRPD's Concord Hills Regional Park Land Use Plan. Both the City, as described in Conservation Measure 3, and the EBRPD will be responsible for tracking and ensuring compliance with the conditions of this Biological Opinion and successful implementation of the Long Term Management Plan.

d. The City will fund the long-term management and monitoring of habitat required by the Long Term Management Plan as described in measure 4(c)(xi). The City will establish a funding mechanism to provide funding for monitoring and management (per the Long Term Management Plan) in the EBRPD PBC Area and City Conservation Lands in perpetuity. Funding for the long-term management and monitoring will be phased in accordance with the phasing of the development of the EDC Area (which will provide the City with the necessary funds). The City will provide a draft PAR or PAR-like analysis for the long-term management and monitoring required by the Long Term Management Plan, funding mechanism description, and funding schedule to the Service prior to the initial assignment of the EBRPD PBC (as described in Conservation Measure 1(b). The City will provide a final funding plan (including funding mechanism, amount, and schedule) to the Service; a final funding plan and PAR must be approved by the Service prior to ground disturbance in the EDC or EBRPD PBC Areas.

e. A Service-approved conservation easement or other Service-approved legal mechanism will be recorded on all EBRPD-PBC parcels for later transfer (see Figure 4) within 60 days of (i) the subsequent transfer of PBC lands to EBRPD, or (ii) the conditions set forth in measure 4(a), above, whichever is later. Any subsequent transfers of PBC lands to EBRPD will be managed

according to the approved Long Term Management Plan described in measure 4(c). The EBRPD will provide the Service with a copy of each agreement after it is recorded.

5. *City Conservation Enhancements in EBRPD PBC Area.*

The City will fund and implement enhancements of habitat for listed species in the EBRPD PBC Area and City Conservation Lands according to a Service-approved HMMP. These enhancements, and thus funding of these enhancements, will be phased in accordance with the phasing of the development of the EDC Area (which will provide the City with the necessary funds). The HMMP will be approved by the Service prior to the initial conveyance of the EDC Area to the City. Concurrent with the HMMP, the City will provide the Service with a draft PAR or PAR-like analysis to determine the funding needed to implement the HMMP, a description of the funding mechanism for the habitat enhancements, and a proposed funding schedule. A final funding plan (including funding mechanism, amount, and schedule) for these enhancements must be approved by the Service prior to ground disturbance in the EDC or EBRPD PBC Areas. The HMMP will include the following:

a. Creation of three to four new breeding ponds for Central California tiger salamander and/or California red-legged frog in the EBRPD PBC Area.

b. Enhancement of existing ponds in the EBRPD PBC. Enhancements may include: sediment/vegetation removal in breeding ponds, pond outlet repair, introduction of fine soil to the bottom of ponds to increase hydroperiod, fence repair and reconfiguration.

c. Upland habitat enhancements such as provision of debris piles to facilitate California ground squirrel establishment in areas with low ground squirrel abundance.

6. *Off-Site Habitat Conservation*

In addition to preservation and management of the On-site Conservation Lands, the City or EDC Area developers will provide off-site habitat conservation to offset effects to listed species resulting from EDC Area development. The acreage of off-site habitat conservation provided by the City will be sufficient to ensure that, in combination with the On-site Conservation Lands, the total compensatory habitat mitigation for the EDC Area-related development is at a 2:1 (acres of conservation: acres of impact) ratio for all City, or City-authorized, development of the EDC Area south of State Route 4 that is not shown as already developed on Figure 2.

The City will determine, in coordination with the Service, the habitat conservation requirements for a given phase of EDC development prior to ground-breaking for that phase. Prior to ground-breaking for a given phase, the City will provide the Service with a map showing that phase of development, the acreage of impacts to listed species' habitat from that phase, a description of the habitat mitigation proposed to compensate for those impacts, and the amount of funding that the City will contribute to support the long-term management of the mitigation lands for that phase in accordance with Conservation Measure 6(d). Ground-breaking for that phase will not occur until the Service has approved the mitigation type, location, and amount.

Phase 1 development activities within the EDC Area will be offset entirely through the City's conservation of On-site Conservation Lands. The City will provide habitat conservation at a 2:1 (conservation:impact) ratio for all City, or City-authorized, development of the EDC Area south of State Route 4 that is not shown as already developed on Figure 2. Those acres will be debited from

the total acreage of On-site Conservation Lands to determine the conservation acreage in the On-site Conservation Lands available for subsequent development phases. As described in Conservation Measure 3(c)(vi), the Executive Director will track the acreage of On-Site Conservation Lands and off-site compensatory mitigation lands the City has already used as mitigation or that are still available as mitigation for future development phases, and this information will be reported to the Service annually as described in Conservation Measure 11(b)(ii). Only the On-site Conservation Lands[6] that have been preserved in accordance with Conservation Measure 4 above will be considered as available On-site Conservation Lands. For subsequent phases of EDC development, the City will provide habitat conservation at a 1:1 ratio on the On-site Conservation Lands and at a 1:1 ratio on off-site conservation lands. On-site Conservation Lands will be debited from the total acreage of available On-site Conservation Lands as habitat conservation is provided for each phase of development until no additional conservation credit is available within the On-site Conservation Lands. Once that point has been reached, for additional EDC development, the City will provide off-site conservation at a 2:1 ratio prior to ground-breaking for that additional development. During any phase of development, the City may (but is not obligated to) increase the amount of credit available within the On-Site Conservation Lands by removing and restoring roads and rail lines to habitat in biologically sensitive areas shown on Figure 7. For every acre of habitat the City restores, two acres of conservation credit will be available to the City.

The City will provide off-site habitat conservation in one of the following forms: (1) payment to the East Contra Costa County Habitat Conservancy, as permitted under Section 9.3.2 of the East Contra Costa County Habitat Conservation Plan/Natural Community Conservation Plan (HCP/NCCP), for the Conservancy's use in acquisition, preservation, and management of habitat; (2) purchase of credits in a Service-approved conservation bank with a service area that includes the Reuse Area; (3) preservation and management of suitable habitat off-site, within the East Contra Costa County HCP/NCCP boundary plus the remainder of the Mt. Diablo Creek watershed (or outside that area with Service approval); or (4) a combination of these approaches.

a. If such off-site conservation takes the form of a payment to the East Contra Costa County Habitat Conservancy (Habitat Conservancy), the funds paid to the Habitat Conservancy will be used for acquisition, protection, and management in perpetuity of habitat for the California red-legged frog and Central California tiger salamander. The acreage of the required conservation habitat will be determined as described above (i.e., to achieve a 2:1 conservation ratio for impacts to any portion of the EDC Area south of State Route 4 that is not shown as already developed on Figure 2, from a given development phase, when combined with any other on-site or off-site conservation habitat provided). As evidence that appropriate mitigation is being provided, the City will provide the Service with an agreement or other document that demonstrates that the Habitat Conservancy has agreed to accept the funds and will use the funds for habitat acquisition and management for these species. The City will provide this agreement/document to the Service prior to ground-breaking for the development activities necessitating this off-site conservation.

[6] Post-remediation revegetation at Site 24A, which includes the City Conservation Lands, has been challenging, and portions of Site 24A will also be used by the City for construction of two water tanks. Only the portions of City Conservation Lands that have revegetated adequately to support grassland or scrub habitat by the time on-site conservation for the last phase of EDC development is needed will be considered as available On-site Conservation Lands.

b. If such off-site conservation takes the form of credits purchased from a Service-approved conservation bank, the City will provide proof of the applicable payment(s) to the Service prior to ground-breaking for the development activities necessitating the off-site conservation.

c. If off-site conservation occurs through preservation and management of suitable habitat off-site (other than through a payment to the Habitat Conservancy or purchase of credits in a conservation bank):

i. Prior to taking title to (or purchasing an easement on) off-site conservation lands, the City will submit to the Service information on the location and acreage of the off-site lands, existing habitat and listed species occurrences on the property, and other relevant information (i.e. title report, etc.) in accordance with any Service-adopted regulations or guidelines then in effect applicable to conserving compensatory mitigation sites. Based on this information, the Service will make a determination about whether the proposed off-site lands are appropriate for conservation.

   A. Habitat in the off-site conservation lands provided for EDC Area-related development will be suitable for both the California red-legged frog and Central California tiger salamander. Suitable habitat will be dominated by grassland, ruderal habitat, oak woodland, or other communities providing suitable conditions for resident and dispersing amphibians, and for Central California tiger salamander it will contain ponds or pools having suitable hydroperiod for Central California tiger salamander breeding and/or be located within 1.3 miles of such ponds or pools. All off-site conservation lands proposed for EDC-area related development will have documented presence of California red-legged frog. Off-site conservation lands proposed as mitigation for development south of Willow Pass Road will also have documented presence of Central California tiger salamander.

ii. The City will preserve off-site lands approved by the Service for conservation through a Service-approved mechanism and will ensure these lands are managed in perpetuity as follows:

   A. The City will provide a draft conservation easement or other legal mechanism to the Service for approval prior to the City taking title to (or purchasing an easement on) the off-site conservation lands.

   B. Following acquisition of the lands, the City will ensure a Service-approved conservation easement or other Service-approved legal mechanism is recorded over the off-site conservation lands, and will provide the Service with a copy of the recorded document prior to ground-breaking for the development necessitating the off-site conservation.

iii. Prior to recording a Service-approved conservation easement or other legal mechanism conserving the off-site lands, the City will submit an off-site Long Term Management Plan to the Service for review and approval. The off-site Long Term Management Plan must be approved by the Service prior to recording the conservation easement (or other legal mechanism). The off-site Long Term Management Plan will describe the measures that the City will take to manage the off-site conservation lands and to monitor the effects of management on the listed species. The off-site Long Term Management Plan

will identify entities to serve as the long-term land manager and easement holder, as well as the entity responsible for providing and tracking funding for long-term management. Monitoring will serve to ensure compliance with the terms and conditions of the Biological Opinion, gauge the effect and effectiveness of management activities, and inform an adaptive management strategy. The off-site Long Term Management Plan will include:

A. A description of the location and boundaries of the off-site conservation lands and description of existing site conditions.

B. A description of measures that will be taken to protect particularly sensitive resources (e.g., breeding ponds).

C. AMMs to address any temporary construction-related impacts associated with maintenance of habitat .

D. A description of maintenance and management activities, including regular maintenance (e.g., of fencing) and less frequent, longer-term maintenance (e.g., maintenance of ponds and berms to ensure long-term functionality as breeding habitat).

E. A description of grazing management, including approximate stocking levels and target Residual Dry Matter (RDM) levels.

F. A description of habitat and species monitoring measures in the off-site conservation lands, including specific, objective performance criteria; monitoring methods (e.g., RDM surveys, livestock use records); data analysis; reporting requirements; monitoring schedule; etc.

G. A contingency plan for elements that do not meet performance criteria; this plan shall include specific triggers for remediation if performance criteria are not being met and a description of the process by which problems (e.g., presence of non-native predators and competitors) will be remediated.

H. A description of the relative roles and responsibilities of the landowner, land manager, and easement holder, as well as the entity responsible for providing and tracking funding for long-term management, in enhancing, managing, maintaining, and monitoring the off-site conservation lands.

d. The City will fund the long-term management and monitoring required by the off-site Long Term Management Plan. Concurrent with the off-site Long Term Management Plan, the City will provide the Service with a draft PAR or PAR-like analysis to determine the funding needed to implement the off-site Long Term Management Plan, a description of the funding mechanism for long term management, and a proposed schedule for providing funding. A final funding plan (including funding mechanism, amount, and schedule) must be approved by the Service prior to ground-breaking for the development requiring the off-site conservation.

7. *Mt. Diablo Creek Riparian Corridor Restoration*
The City will restore and enhance riparian habitat in conjunction with implementing flood management and bank stabilization measures along the Mt. Diablo Creek Riparian Corridor. The City will prepare a Riparian Habitat Enhancement and Management Plan for review by the Service. The plan must be approved by the Service prior to ground-breaking in the EDC Area[7]. The City will be responsible for implementing monitoring and management in the Riparian Corridor according to this plan. The Riparian Habitat Enhancement and Management Plan will include the following and a schedule for implementing the following:

a. Bridge Removal and Bank/ Channel Restoration. The Area Plan includes the removal of 14 existing culverts carrying segments of Mt. Diablo Creek under crossings (and construction of nine new crossings, as described previously). Where existing bridges are removed, the City will restore the channel bed, banks, and riparian vegetation to natural conditions.

b. *Channel and Bank Modifications.* From Bailey Road downstream to State Route 4, the City will implement channel and bank modifications that will increase the width of the Riparian Corridor substantially. In many areas, the City will lay back steep banks to establish a 3:1 (horizontal to vertical) slope to provide geomorphic stability and create a suitable planting surface for native vegetation.

c. *Riparian Vegetation Restoration and Enhancement.* Riparian vegetation within the Mt. Diablo Creek Riparian Corridor is currently largely restricted to trees and shrubs that are rooted near the edge of the low flow channel. The City's proposed habitat restoration will create conditions where up to 80 acres of new riparian, oak woodland, and oak savannah vegetation can be established in areas well away from the low flow channel by converting steep eroding banks to new floodplains and moderately stable slopes.

d. *Topsoil Harvesting and Reapplication.* To ensure vegetation establishment, the City will harvest and stockpile topsoil within the graded areas along Mt. Diablo Creek and within adjacent uplands and apply it to areas that have been graded to subsoil where riparian forest, riparian woodland, and oak savanna habitats are proposed. If existing topsoil demonstrates the need for soil amendments to improve planting/revegetation, the City will amend the top 6 inches of reapplied topsoil with compost and/or nutrients to improve soil conditions (e.g., soil structure, organic matter content, and nutrient availability).

e. *Incorporation of Habitat Features.* To increase habitat values for wildlife, the City's restoration design will incorporate features such as instream structures, coarse woody debris, and depressional areas (including wetlands) in newly created floodplains.

f. *Refuse Removal.* The City will remove accumulations of trash and other unwanted debris from the creek channel, and will revegetate the affected area with native plants, to improve overall habitat quality. In addition, the City will regularly maintain the Mt. Diablo Creek Riparian Corridor to remove any new trash or unwanted debris from the creek channel.

[7] Implementation of the Riparian Habitat Enhancement and Management Plan will improve habitat conditions along the Mt. Diablo Creek corridor. Therefore, preservation of on-site and off-site conservation lands (described in Conservation Measures 4 and 6) will not be required for impacts to portions of the Mt. Diablo Creek corridor that will not be developed (e.g. by creek crossings).

g. *Control of Invasive Plants.* A total of 2.4 acres of woody and nonwoody invasive plants have been mapped in the creek corridor. The City will control or eradicate stands of invasive plants to help existing native vegetation thrive, create space for new native vegetation to become established, and hinder the spread of invasive species. The City will maintain areas where invasive plants have been removed to facilitate the re-establishment of native vegetation and hinder the spread of invasive species.

h. *Habitat Management.* A description of measures that will be implemented by the City to manage habitat enhancement features.

8. *Conservation Measures and Siting Guidelines for Educational Displays, Recreation Facilities, and Park Operation Facilities in the Regional Park (EBRPD PBC Area)*

EBRPD shall implement the following measures within the EBRPD PBC Area. These measures, including siting guidelines, will be integrated into EBRPD's Land Use Plan for the Concord Hills Regional Park and implemented by the EBRPD to minimize and avoid impacts on sensitive species and habitat in the regional park and ensure protection of the conservation lands. The EBRPD will also identify habitat enhancements that will be implemented by EBRPD to offset impacts associated with the development associated with implementation of the Concord Hills Regional Park Land Use Plan. The uses and facilities discussed below are intended to be examples of the types of park uses anticipated and do not represent a comprehensive list of allowable uses. These measures and the types and locations of facilities will be further refined in the Concord Hills Regional Park Land Use Plan and Service-approved Long Term Management Plan (Conservation Measure 4(c).

a. EBRPD will provide no more than 13 small picnic areas consisting of one or two picnic tables within Conservation Zone 2 of the EBRPD PBC Area. EBRPD will select locations that will minimize impacts to listed species for these facilities and potential locations will be described in the Long Term Management Plan to be submitted to the Service for approval (Conservation Measure 4(c). Picnic tables will be sited over 500 feet from any breeding habitat for California red-legged frog or Central California tiger salamander and will include signage and facilities necessary to minimize litter and food waste. In addition, only animal-resistant trash/recycling receptacles approved by the Service will be used in these areas. EBRPD will empty such receptacles on a daily basis, if necessary, to prevent the overflow of trash, consistent with the litter and waste management program described below. Picnic areas will be operated only during daylight hours and could include restrooms and potable water if approved by the Service. No irrigated turf or non-native landscaping shall be allowed in picnic areas. To the extent feasible, EBRPD will site picnic areas within already disturbed areas.

b. EBRPD may develop a total of up to five group picnic sites on the lower elevations of the EBRPD PBC Area pending Service approval and shall target higher use areas for location of those group picnic sites (e.g., staging areas, the Visitor Center, the City sports complex, and public roads). EBRPD will select specific locations and number of group picnic sites so as to minimize impacts to listed species, and will describe potential locations in the Long Term Management Plan to be submitted to the Service for consideration and approval (Conservation Measure 4(c). EBRPD will site all picnic sites over 1,000 feet from any California red-legged frog or Central California tiger salamander breeding habitat, and no group picnic sites will be located southwest of Kinne Boulevard in proximity to Mt. Diablo Creek. These picnic sites will consist of up to 10 picnic tables to accommodate larger groups and will include signage and facilities necessary to limit litter and food waste. Picnic areas will be operated only during daylight hours and could include restrooms and potable water. No irrigated turf or non-native landscaping shall

be allowed in picnic areas. To the extent feasible, EBRPD will site picnic areas within already disturbed areas.

c. EBRPD may develop one small primitive backpack camp within Conservation Zone 2. Any backpack (hike-in) camp located in Conservation Zone 2 will be described in the Long Term Management Plan (Conservation Measure 4(c)) and will be sited at least 1,000 feet from any known listed species breeding habitats. EBRPD will limit use to no more than 25 people. Restrooms, potable water, and trash receptacles will be provided. Private vehicles will not be allowed to drive into the backpack camp. This restriction will not apply to maintenance and emergency vehicles. With the exception of Americans with Disabilities Act (ADA) service animals, dogs will only be allowed in backpack camps on-leash. The EBRPD will ensure that use of backpack camps is adequately supervised and controlled, and may implement a reservation and permitting process for use of the backpack camp.

d. EBRPD will include a dog management section in the Long Term Management Plan (Conservation Measure 4(c). This section will identify areas suitable for dog access and areas where no dogs will be permitted. No dogs will be allowed in wetland or marsh areas, areas where prohibited by the Long Term Management Plan or any permit, or any other area designated as restricted.

e. EBRPD will site new trails and roads and all other recreational facilities (e.g., visitor center, parking lots, and picnic areas) to maintain a buffer of at least 500 feet from California red-legged frog and Central California tiger salamander breeding habitat.

f. EBRPD will realign existing trails and roads located within 500 feet of existing or proposed California red-legged frog and/or Central California tiger salamander aquatic breeding sites, where possible, to ensure a minimum 500 foot buffer from such breeding sites. EBRPD will decommission trails and roads that are within the 500 foot buffer and restore the site to natural conditions. Where realignment is not possible, or would result in greater environmental impacts, the Long Term Management Plan (Conservation Measure 4(c)) shall identify fencing, signage, and other management barriers suitable to restrict trail users to trails.

g. EBRPD will reroute the existing ridgetop road/trail adjacent to the Hilltop Ponds to maximize the distance between the trail and the ponds (Figures 5 and 6).

h. EBRPD will manage all Resource Protection Zones solely for resource protection and no public access or trail use will be permitted. These Resource Protection Zones include approximately 400 acres around Rattlesnake Canyon; approximately 35 acres around Cistern Pond; and approximately 185 acres around the Hilltop Ponds, Eagles Nest site, and Indian Springs (see Figure 8). California red-legged frog breeding sites that do not retain water year round and perennial aquatic habitat or riparian habitat are encompassed within Resource Protection Zones, allowing for potential dispersal between such areas.

i. To offset the loss of a maximum of approximately 16.5 acres of presently undeveloped land, including approximately 6.2 acres of disturbance around the proposed visitor center and other park facilities, and approximately 6.1 miles (9.6 acres) of new trail connections and 0.3 mile (0.7 acre) of new roads, EBRPD will remove 10.3 miles of rail lines in biologically sensitive areas as shown on Figure 7. Rail ties and associated rock will also be removed along a 5.6-mile portion of these former rail lines, which will be converted to trail. Further, the EBRPD will restore up to

5.7 miles of unutilized unpaved roads within Resource Protection Zones, as shown on Figure 7, to deter public use of areas closed to recreation. This may include the restoration of certain segments of existing roads near sensitive areas such that access for management would still be possible but that any existing unpaved roads that would make attractive hiking loops would be restored to natural habitats to deter use. The Concord Hills Regional Park Land Use Plan and any HMMP prepared by EBRPD for the EBRPD mitigation will describe how removal and restoration of roads and rail lines will be prioritized to meet this requirement and provide the most benefit to listed species as determined in coordination with the Service. Infrastructure removal and restoration may occur in phases, so long as completed prior to or in conjunction with any development of presently undeveloped land for park uses. The restored habitats will be managed as described in the Long Term Management Plan (Conservation Measure 4(c).

j. Roads within 300 feet of California red-legged frog and/or Central California tiger salamander breeding habitat will have a maximum speed limit of 20 miles per hour. The only road segment currently anticipated to be subject to this limitation is a segment located east of the Cistern Pond Resource Protection Area that is less than 0.25 miles in length.

k. The Long Term Management Plan shall identify fencing plans throughout the On-site Conservation Areas. Where appropriate, fences or other symbolic barrier shall be erected around California red-legged frog and/or Central California tiger salamander breeding sites as appropriate to deter off-trail use of these aquatic habitats by park users. Fencing will be placed 75 feet from the aquatic habitat and will include signs informing visitors of the importance of protecting the listed species and habitats that occur at these locations and relevant laws and penalties for harming or harassing these species. If it is determined by the Service that fencing of aquatic habitats is not appropriate, alternative strategies to ensure deterrence of off-trail use, including fencing of trail corridors, shall be explored.

l. Park uses around the larger rock outcroppings that provide potential habitat for the Alameda whipsnake will be limited to non-motorized passive recreational use. Informational signage will be installed to educate visitors regarding potential Alameda whipsnake habitat.

m. No lighting will be placed within or immediately adjacent to (within 500 feet of) known California red-legged frog and/or Central California tiger salamander breeding habitat or proposed breeding ponds for these species. Lights will be directed away from breeding habitat, will be limited to the minimum number required for human safety and facility security, and will follow Lighting Zone 1 guidelines (as defined in the Illuminating Engineering Society of North America's Recommended Practice 33 and referenced in Leadership in Energy & Environmental Design guidance). Locations where lighting is proposed will be described in the Long Term Management Plan (Conservation Measure 4(c).

n. Normal park operating hours will be limited to dawn to dusk. EBRPD will limit nighttime recreation, with the exception of camp facilities, to occasional (not more than twice per month unless specifically approved by the Service) interpretive and/or recreational events specifically approved by EBRPD. These nighttime activities will not occur when there is a 50 percent or greater probability of rain (based on the nearest National Weather Service forecast).

o. EBRPD will prohibit collection of aquatic organisms within the regional park and prohibit the release of aquatic organisms into any water body or waterway in the regional park, without prior Service approval.

p. Entrance points to existing roads, trails, and railroad tracks that are not designated as part of the regional park facilities will be closed using signage, barriers (e.g., fencing or planted vegetation), and/or, mechanical removal and revegetation of the feature.

q. EBRPD will implement a litter and waste management program to effectively meet demand and ensure that all trash is properly contained and unavailable to nuisance/predatory wildlife species. Elements of this program will include staff outreach and public education, routine litter and nuisance pickup and removal, and availability of sufficient waste containers. Waste containers will be designed so that animals such as common ravens (*Corvus corax*) and raccoons (*Procyon lotor*), which are predators of special-status species, cannot remove the trash within. These containers will be emptied regularly to prevent overfilling.

9. Construction-related Avoidance and Minimization Measures for all City, EBRPD, and First Responder Training Facility Activities

Implementation of the Area Plan within the CNWS Reuse Area will be phased, and the following avoidance and minimization measures (AMMs) will apply to each phase of development as well as enhancement and restoration activities. The City will be responsible for implementing these AMMs or ensuring that they are implemented by making them enforceable conditions of approval of any permits or entitlements authorizing development within the City Property. The City will also implement these AMMs when City-required enhancement or restoration occurs on the EBRPD PBC Area. The EBRPD will be responsible for implementing these AMMs, as applicable, for all other activities in the EBRPD PBC Area. In the discussions of the AMMs below, the term "project proponent" refers to the entity that is implementing a development activity requiring compliance with these AMMs, which may include the City, EBRPD, a developer, or a contractor.

Because the BART and County PBC lands (see Figure 1) are already developed and thus do not provide suitable habitat for listed species, AMMs will not be implemented for redevelopment on those lands. On the golf course, only those AMMs followed by an asterisk (*) below will be implemented and then only for major construction activities (i.e., road construction or major realignment of fairways associated with the road construction). AMMs for Alameda whipsnake will only be implemented southeast of Bailey Road.

a. *SWPPP.* For all construction activity involving clearing, grubbing, or grading, the project proponent will implement a Stormwater Pollution Prevention Plan (SWPPP) containing Best Management Practices (BMPs) designed to prevent construction-related discharge into surface waters. BMPs for water quality shall be implemented during all construction activities within the bed and banks of Mt. Diablo Creek, Willow Pass Creek, and other drainages, and in upland areas where runoff could transport materials, to minimize mobilization of sediments and other harmful materials into downstream areas. These BMPs must consider not only mobilization of sediments during construction (which will likely occur primarily in dry conditions), but also the potential for sediments loosened by construction activities to be moved downstream during the following wet season. These BMPs must address at least the following items: mobilization of sediment due to gravity, erosion, or runoff during construction; potential spills of fuel or other chemicals into aquatic habitats; operation of equipment within flowing water; and stabilization (e.g., with vegetative cover) of any bare soils to prevent erosion and sedimentation.*

b. *Restoration of Temporary Impacts.* Areas that are temporarily affected by project-related work and that are not proposed for subsequent development will be restored by the project proponent to

pre-existing or better condition upon completion of work according to a Service-approved revegetation plan. Restored areas will be monitored for two years post-construction to determine whether restoration was successful as defined in the revegetation plan. The City will provide the results of post-construction monitoring to the Service. Areas that are impacted by project-related work and that will lie dormant (without further disturbance) for more than one year before development activities re-commence will be revegetated with an appropriate herbaceous seed mix to inhibit colonization of disturbed areas by invasive plants, followed by monitoring to insure that no large infestations of invasive plants occur. Potential examples of the latter category include IR Site 22, where remediation may either be closely coordinated with redevelopment or precede redevelopment by a year or more, and areas where soil is stockpiled for subsequent development uses.

c. *Biologist Approval.* Prior to ground-disturbing activities, the project proponent shall submit the name(s) and credentials of biologist(s) that will conduct the activities specified in the following measures to the Service. No project-related work for the proposed activity will begin until written approval that the biologist(s) is qualified to conduct the work has been received from the Service. The biologist(s) shall be given the authority to stop any work that may result in the take of listed species. If the biologist(s) exercises this authority, the Service shall be notified by telephone and electronic mail within one (1) working day. The Service-approved biologist will be the contact for any employee or contractor who might inadvertently kill or injure a Central California tiger salamander, California red-legged frog, or Alameda whipsnake or anyone who finds a dead, injured, or entrapped individual of these species. The Service-approved biologist shall possess a working cellular telephone whose number shall be provided to the Service.*

d. *Worker Environmental Awareness Program.* The project proponent will ensure a Worker Environmental Awareness Program (WEAP) is given to all construction personnel before the commencement of vegetation clearing or ground-disturbing activities, such as grading. A Service-approved biologist shall explain to construction workers how best to avoid the accidental take of Central California tiger salamanders and California red-legged frogs; information regarding Alameda whipsnakes will be included in the WEAP training for any project-related activities in the portions of the EBRPD PBC southeast of Bailey Road. This training session shall be required as a mandatory informational field meeting for contractors and all construction personnel. Interpretation will be provided for non-English speaking workers. The field meeting shall include information on species identification, life history, descriptions, and habitat requirements during various life stages. Emphasis shall be placed on the importance of the habitat and life stage requirements within the context of relevant AMMs. Handouts, illustrations, photographs, and maps showing areas where minimization and avoidance measures must be implemented shall be included as part of this education program. The WEAP shall increase the awareness of the contractors and construction workers about existing federal and state laws regarding endangered species, as well as increase their compliance with all local, state, and federal permit conditions. When new personnel are added to the project, they will receive the mandatory training before starting work. Proof of worker attendance will be kept on file by the City, EBRPD, or the County as applicable.*

e. *Listed Species Relocation Plan.* Prior to the initiation of any ground-disturbing activities, the project proponent will submit a relocation plan for listed species to the Service for approval. The plan will identify appropriate relocation methods and sites for any adult, juvenile, or larval Central California tiger salamander or California red-legged frog that may be observed during

the pre-construction surveys (described below) or during construction monitoring and that may need to be relocated.*

f. *Upland Work Window.* Ground-disturbing activities, including vegetation removal that results in soil disturbance (e.g., grubbing), site grading, utilities trenching, and outfall construction, will be performed between 30 April and October 15 (or the first measurable fall rain of 1cm) to minimize the potential for impacts on California red-legged frogs and Central California tiger salamanders moving aboveground. Ground-disturbing activities may occur outside this work window only with Service approval. The following types of work may continue during the wet season within established work areas enclosed in exclusion fencing (Conservation Measure 9(h) below) without the need for additional Service approval: fine grading, placement of fill, planting, paving, concrete pouring, and structural construction.

g. *Aquatic Work Window.* Activities that directly impact habitat that is ponded at the time of construction (i.e., ponds or pools within creeks) shall occur during the July–October period to avoid the period when California red-legged frog and Central California tiger salamander larvae are most likely to be present. In-water work will take place as late as feasible within this work window. For seasonal waterbodies that are dry (i.e., that have no surface water) when construction occurs, the Upland Work Window described in Conservation Measure 9(f) applies.

h. *Wildlife Exclusion Fencing.* Prior to pre-construction surveys, all construction areas will be enclosed with a minimum of 3-foot-high (or taller) silt fence or similar material, of which approximately 6 inches will be buried underground, that will remain in place during construction in order to prevent Central California tiger salamanders and California red-legged frogs from entering the construction area. Escape ramps, funnels, or other features that allow animals to exit the fenced construction area, but which will prohibit the entry of such animals, shall be provided in the exclusion fencing. Cover boards to provide cover for individuals will be spaced regularly along both sides of the exclusion fencing. The project proponent will provide a fencing plan detailing the locations and design/materials for this exclusion fencing to the Service for review prior to fence installation. A qualified biologist shall conduct a pre-construction survey of the fence installation area immediately prior to (i.e., the day of) the commencement of installation and shall monitor fence installation. Fencing will be maintained for the duration of construction for that activity/phase of work. For CERCLA remediation work at IR Site 22, the Navy (or City, in the case of an early transfer) will submit an exclusion fencing plan (in the Remedial Design or other appropriate CERCLA documentation) for Service review and approval prior to fence installation.

i. *Exclusion Fence Monitoring.* Within the EBRPD PBC Area, for the duration exclusion fencing is installed, a Service-approved biologist will walk exclusion fence lines each morning prior to 10 a.m. to monitor fencing integrity and to look for listed species stranded along the fence line (including under cover boards). If California red-legged frogs or Central California tiger salamanders are found stranded along the fence line, the Service-approved biologist will move the individual according to the approved relocation plan (Conservation Measure 9(e)). Within the EDC Area, a Service-approved biologist will walk exclusion fence lines at least one time per week to monitor fencing integrity and to look for listed species stranded along the fence line. If California red-legged frogs or Central California tiger salamanders are found stranded along the fence line within either the EDC or EBRPD PBC Areas, a Service-approved biologist will move the individual according to the approved relocation plan (Conservation Measure 9(e). Should a listed species be found along a fence line when a Service-approved biologist is not on site, a

Service-approved biologist will immediately be contacted to move the individual according to the approved relocation plan. Should listed species be found stranded along exclusion fencing, the Service will be contacted to determine whether additional monitoring or adjustments fencing design are needed.

j. *Exclusion Fencing Alternative.* In areas where exclusion fencing is not feasible (for instream work or work in very rocky areas), or where installation of such fencing may cause more damage than construction activities, as determined by a Service-approved biologist, the Service-approved biologist shall conduct a pre-construction survey (Conservation Measure 9(m) and will contact the Service to determine whether additional construction monitoring or other measures should be implemented.

k. *Preconstruction Surveys.* After exclusion fence is installed and immediately prior to construction, the following wildlife surveys will be performed by a Service-approved biologist within the fenced area according to the following protocols:

i. Any ponds or pools where work will take place shall be seined for Central California tiger salamander and California red-legged frog larvae within seven days prior to construction. Pools or ponds that will be impacted by construction will be pumped or drained during the seining so they are dewatered prior to earth-moving, fill, or construction in that feature. Any Central California tiger salamander or California red-legged frog larvae found during seining shall be salvaged and relocated by a Service-approved biologist according to the approved species relocation plan.*
ii. Within 48 hours before the onset of construction activities, a Service-approved biologist shall conduct one nighttime survey and one daytime survey of any wetlands, streams, ponds, riparian habitats, and areas within 200 feet of these features, within the construction area. During the preconstruction surveys, the biologist shall also include a pedestrian survey of the entire impact area to survey for California red-legged frogs and Central California tiger salamanders in vegetation, under debris, in culverts, or in other areas that could provide refugia for these species. If Central California tiger salamanders or California red-legged frogs of any life stage are found, they shall be moved according to the species relocation plan.*
iii. A Service-approved biologist will survey for Alameda whipsnakes immediately prior to (i.e., the same day as) the onset of any construction activities southeast of Bailey Road. If Alameda whipsnakes are found, they will be relocated according to the species relocation plan.

l. *Dewatering.* If it is necessary to divert water or conduct dewatering, the following measures will be implemented as applicable:

i. Equipment and machinery will be inspected and cleaned of non-native invasive vegetation prior to on-site use.
ii. Water diversion techniques will allow stream flows to gravity flow around or through the work site if feasible.
iii. If a work site must be dewatered by pumping, intakes will be screened with wire mesh screening not to exceed 3/32 inch. Pump intakes will be placed in perforated intake basins to allow water to be drawn into the pump while protecting aquatic organisms. Both the outside of the intake basin and the pump intake itself will be screened to ensure that aquatic organisms are not pulled into the pump.

iv. Water will be released or pumped downstream at an appropriate rate to maintain downstream flows during construction and will be discharged in a non-erosive manner (e.g., gravel or vegetated bars, on hay bales, etc.).
v. A Service-approved biologist will be on-site to monitor all dewatering activities and check the dewatered area for listed species. If listed species are found within the work area, the Service-approved biologist will relocate them according to the approved species relocation plan (Conservation Measure 9(e).
vi. No stream water will be allowed to contact uncured concrete or mortar. If any wet concrete, cement, slurry, or washings thereof inadvertently enter the stream, all construction activities shall immediately cease until the material is cleaned up and removed from the channel.*

m. *Remediation Fencing.* Wildlife exclusion fencing implemented during Navy remediation activities within the EDC Area may be maintained by the City after completion of remediation to prevent re-occupancy of these disturbed areas until development-related construction activities occur. The City will make this determination in coordination with the Service based on conditions at the time remediation is complete.

n. *Speed Limit.* Construction-related vehicles will observe a 20 mile-per-hour speed limit in all construction areas (this does not apply on City and County roads and State highways).

o. *Daily Work Window.* Work will be limited to daylight hours from 30 minutes after sunrise until 30 minutes before sunset unless the Service provides written approval, on a site-by-site or activity-by-activity basis, for performance of work during other times. The Service may require the implementation of additional avoidance measures (i.e. restrictions on lighting or on work during rain events) for night work.

p. *Pipe/Culvert Capping.* Central California tiger salamanders and California red-legged frogs are attracted to structures providing cavities such as pipes, and they may enter stored pipes and become trapped. Therefore, all construction pipes, culverts, or similar structures that are stored at ground level at a construction site for one or more overnight periods will be either securely capped prior to storage or thoroughly inspected by the Service-approved biologist and/or the construction monitor for these animals before the pipe is subsequently buried, capped, or otherwise used or moved in any way. If a Central California tiger salamander or California red-legged frog is discovered inside a pipe, a Service-approved biologist shall move the animal to a safe nearby location in accordance with the species relocation plan.*

q. *Trash Disposal.* To eliminate an attraction to the predators of the Central California tiger salamander, California red-legged frog, and Alameda whipsnake all food-related trash items such as wrappers, cans, bottles, and food scraps will be disposed of in solid, closed containers (trash cans) and removed from construction sites daily.*

r. *Take Notification.* Any contractor, employee, or agency personnel who inadvertently kills or injures a Central California tiger salamander, California red-legged frog, or Alameda whipsnake will immediately report the incident to a Service-approved biologist. The biologist will contact the Service to report the dead or injured animal via electronic mail and telephone within one working day.*

s. *Erosion Control.* Tightly woven fiber netting or similar material shall be used for erosion control or other purposes to ensure that individuals are not trapped. Plastic monofilament netting (erosion control matting) or similar material shall not be used because Central California tiger salamanders and California red-legged frogs may become entangled or trapped in it. This limitation will be communicated to the contractor through use of Special Provisions included in the bid solicitation package.*

t. *Entrapment Avoidance.* To prevent inadvertent entrapment of individuals during construction, the on-site biologist and/or construction foreman/manager shall ensure all excavated, steep-walled holes or trenches more than 1-foot deep, are completely covered at the close of each working day by plywood or similar materials, or provided with one or more escape ramps constructed of earth fill or wooden planks and inspected by the on-site biologist. Before such holes or trenches are filled, they will be thoroughly inspected for trapped animals by the Service-approved biologist and/or designated construction monitor. If at any time a trapped Central California tiger salamander or California red-legged frog is discovered, a Service-approved biologist shall move the animal in accordance with the relocation plan.*

u. *Construction Monitoring by Service-approved Biologist.* Within the EBRPD PBC Area, a Service-approved biologist will be present to monitor all work activities that may result in take of listed species. Within the EDC Area, a Service-approved biologist will be present during initial ground-disturbing activities (i.e., clearing and grubbing). If a listed species is observed within a work area, all work that could potentially harm the individual will be stopped until the individual moves out of the work area or a Service-approved biologist has moved the individual out of the work area in accordance with the species relocation plan. Within the EDC Area, once clearing and grubbing within a given area are completed, and the site has been completely surrounded by exclusion fencing, daily construction monitoring by a Service-approved biologist will no longer be necessary, but the biologist will conduct spot-checks once/week until grading is completed. The biologist will also be present during any other construction activities that, in the Service-approved biologist's opinion, have a high probability of resulting in take (e.g., during construction activities near breeding habitat or other sensitive habitats for these species).

v. *Construction Monitor.* Once initial ground disturbance and work in sensitive habitats within the EDC Area is complete, the project proponent will designate a construction monitor to monitor on-site compliance with all AMMs during ongoing project work. This individual must receive the WEAP training and be trained in the identification of California red-legged frog, Central California tiger salamander, and Alameda whipsnake. If a listed species or any animal that construction personnel believes may be one of these species, is encountered during construction, the following protocol shall be followed:

i. All work that could result in direct injury, disturbance, or harassment of the individual animal shall immediately cease.
ii. The foreman and a Service-approved biologist shall be immediately notified.
iii. A Service-approved biologist shall move the individual to a safe nearby location in accordance with the relocation plan (Conservation Measure 9(e).
iv. The Service-approved biologist shall notify the Service via telephone or electronic mail within one working day.
v. A written report (which may be via electronic mail) will be provided to the Service documenting the detection of the animal, the species involved, and the measures taken

(including relocation location and methods) to ensure that the animal was not harmed by construction will be provided to the Service within 5 working days of the relocation.*

10. *Outfalls.*
If outfalls to Mt. Diablo Creek (e.g., stormwater outfalls or outfalls from retention basins) are necessary, the plans/designs for the outfalls will be submitted to the Service. If the Service determines the outfall(s) will have an adverse effect on listed species that exceeds the effects already addressed in this Biological Opinion (i.e. changes in stream hydrology or additional take of listed species), the Service will notify the City, in writing that the outfalls are not covered by this Biological Opinion.

11. *Annual Reporting.*
The Executive Director will provide the Service with an Annual Report every year, no later than the first business day of March, until the EDC Area development is completed and the City fulfills the corresponding compensatory mitigation measures described in Conservation Measures 4 and 6. The Annual Report will address the status of Area Plan implementation, including EDC Area property transfers, EDC Area development, on-site and off-site compensatory mitigation (Conservation Measures 4, 6), habitat enhancements in the On-site Conservation Lands (Conservation Measure 5), and the riparian habitat enhancements (Conservation Measure 7) that the City is responsible for implementing under this Biological Opinion.[8] The Annual Report will include or describe:

a. The status of the EDC Area conveyances. The Annual report will include a figure showing the land the Navy transferred to the LRA through December 31 of the prior year.

b. An accounting of all EDC Area land the City developed, or authorized the development of, through December 31 of the prior year and the acreage and location of the corresponding compensatory mitigation. This will include:

vi. Conversion: The annual incremental and cumulative EDC Area converted to development.
vii. Mitigation (Preservation): The annual incremental acreage provided as compensatory mitigation in accordance with Conservation Measures 4 and 6, with a breakdown of the acreage preserved within the EBRPD PBC Area, City Conservation Lands, or off-site. The Annual Report will include evidence the City provided the corresponding Service-required long-term habitat management and monitoring funding.
viii. Mitigation (HCP/NCCP Payment or Bank Credits): A summary of the compensatory mitigation the City provided in accordance with Conservation Measure 6 by providing funds to the East Contra Costa County Habitat Conservancy or purchasing conservation bank credits, and evidence the funds were provided or credits purchased.
ix. Mitigation (Enhancements): The status of the habitat enhancements described in Conservation Measure 5 (habitat enhancements in the On-site Conservation Lands).
x. Net Acreage: The overall acreage of preserved habitat, a breakdown of the total acreage preserved by location, the mitigation available for offsetting future development (mitigation earned by preserving and implementing the long term management and monitoring in advance of EDC Area development), and the acreage that is still available

[8] The Long Term Management Plan for the On-site Conservation Lands (Conservation Measures 1(b), 4(c), HMMP (Conservation Measure 5), Riparian Habitat Enhancement and Management Plan (Conservation Measure 7), and any off-site habitat long term management plan (Conservation Measure 6(c)(iii)) likely will include reporting requirements. The Annual Report will not duplicate those reporting requirements.

for preservation in the EBRPD PBC Area, City Conservation Lands, or off-site mitigation area(s).

xi. The results of the LRA's site inspection described in Conservation Measure 3(c)(viii).

c. The estimated amount of development within the EDC Area the City anticipates will occur during the current calendar year and the corresponding mitigation the City will provide.

d. A summary of the City's compliance with the AMMs included in Conservation Measure 9 and Conservation Measures 10, 12, and 13. This may be provided in the form of a table with notes showing compliance with the AMMs and other conservation measures.

12. *Public Outreach Measures.*

a. Within the EDC Area, the City will distribute pamphlets to all residents explaining the importance of maintaining control of pets and avoiding sensitive areas in their proximity.

b. Within the EDC Area and the EBRPD PBC Area, the City and EBRPD will install signage adjacent to the Mt. Diablo Creek Corridor to provide information to residents and visitors about the presence of special-status species and discourage disturbance.

13. *Lighting Measures*

Within the EBRPD PBC Area, portions of the EDC Area that are within 300 feet of Mt. Diablo Creek or 300 feet of the EBRPD PBC Area, and within City Conservation Lands, the following measures will be implemented to minimize effects of lighting:

a. Lights will be directed downward (no uplighting).

b. Low-output fixtures will be used.

c. Overlighting will be avoided by lighting only key connecting routes, being selective as to which routes are lit, and lighting those routes to the lowest possible level for safety and security.

d. Glare shields, louvers, or other accessories to reduce unwanted light spill and direct view of light sources will be implemented.

e. Lighting controls will be linked to astronomical time clocks and/or photocells, with the possibility of dimming or switching off completely after a certain time.

14. *Conservation Measure Modifications*

Because of the extended time period over which conservation measures will be implemented, the Navy, Corps, City, or EBRPD may propose minor modifications to these conservation measures, along with a justification for the proposed modification to the Service for consideration. The Service may approve minor modifications to conservation measures if the Service determines that the modification will not result in adverse effects to listed species beyond those analyzed in this Biological Opinion.

Action Area

The action area is defined in 50 CFR § 402.02, as "all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action." For the proposed project, the action area encompasses the 5,074-acre Reuse Area.

Analytical Framework for the Jeopardy Determination

In accordance with policy and regulation, the jeopardy analyses in this biological opinion rely on four components: (1) the *Status of the Species*, which evaluates the California red-legged frog, Central California tiger salamander, and Alameda whipsnake range-wide condition, the factors responsible for that condition, and their survival and recovery needs; (2) the *Environmental Baseline*, which evaluates the condition of the Central California tiger salamander, California red-legged frog, and Alameda whipsnake in the action area, the factors responsible for that condition, and the relationship of the action area to the survival and recovery of these species; (3) the *Effects of the Action*, which determines the direct and indirect impacts of the proposed Federal action and the effects of any interrelated or interdependent activities on the Central California tiger salamander, California red-legged frog, and Alameda whipsnake; and (4) *Cumulative Effects*, which evaluates the effects of future, non-Federal activities in the action area on the Central California tiger salamander, California red-legged frog, and Alameda whipsnake.

In accordance with policy and regulation, the jeopardy determination is made by evaluating the effects of the proposed Federal action in the context of the Central California tiger salamander, California red-legged frog, and Alameda whipsnake current status, taking into account any cumulative effects, to determine if implementation of the proposed action is likely to cause an appreciable reduction in the likelihood of both the survival and recovery of these species in the wild.

The jeopardy analysis in this biological opinion places an emphasis on consideration of the range-wide survival and recovery needs of Central California tiger salamander, California red-legged frog, and Alameda whipsnake and the role of the action area in the survival and recovery of these species as the context for evaluating the significance of the effects of the proposed Federal action, taken together with cumulative effects, for purposes of making the jeopardy determination.

Status of the Species

Central California Tiger Salamander

For the most recent comprehensive assessment of the species' range-wide status, please refer to the draft recovery plan for the Central California tiger salamander (Service 2016) and the Central California tiger salamander 5-year Review (Service 2014). No change in the species' listing status was recommended in this 5-year review. Threats evaluated during that review and discussed in the final document have continued to act on the species since the 2014 5-year review was finalized. While there have been continued losses of Central California tiger salamander habitat, to date no project has proposed a level of effects for which the Service has issued a biological opinion of jeopardy for the species. The Service is in the process of finalizing a draft recovery plan for the species (Service 2016).

California Red-legged Frog

Listing Status: The California red-legged frog was listed as a threatened species on May 23, 1996 (Service 1996). Critical habitat was designated for this species on April 13, 2006 (Service 2006) and revisions to the critical habitat designation were published on March 17, 2010 (Service 2010). At this time, the Service recognized the taxonomic change from *Rana aurora draytonii* to *Rana draytonii* (Shaffer *et al.* 2010). A recovery plan was published for the California red-legged frog on September 12, 2002 (Service 2002).

Description: The California red-legged frog is the largest native frog in the western United States (Wright and Wright 1949), ranging from 1.5 to 5.1 inches in length (Stebbins 2003). The abdomen and hind legs of adults are largely red, while the back is characterized by small black flecks and larger irregular dark blotches with indistinct outlines on a brown, gray, olive, or reddish background color. Dorsal spots usually have light centers (Stebbins 2003), and dorsolateral folds are prominent on the back. Larvae (tadpoles) range from 0.6 to 3.1 inches in length, and the background color of the body is dark brown and yellow with darker spots (Storer 1925).

Distribution: The historic range of the California red-legged frog extended from the vicinity of Elk Creek in Mendocino County, California, along the coast inland to the vicinity of Redding in Shasta County, California, and southward to northwestern Baja California, Mexico (Fellers 2005; Jennings and Hayes 1985; Hayes and Krempels 1986). The species was historically documented in 46 counties but the taxa now remains in 238 streams or drainages within 23 counties, representing a loss of 70 percent of its former range (Service 2002). California red-legged frogs are still locally abundant within portions of the San Francisco Bay area and the Central California Coast. Isolated populations have been documented in the Sierra Nevada, northern Coast, and northern Transverse Ranges. The species is believed to be extirpated from the southern Transverse and Peninsular Ranges, but is still present in Baja California, Mexico (CDFW 2016).

Status and Natural History: California red-legged frogs predominately inhabit permanent water sources such as streams, lakes, marshes, natural and manmade ponds, and ephemeral drainages in valley bottoms and foothills up to 4,921 feet in elevation (Jennings and Hayes 1994, Bulger *et al.* 2003, Stebbins 2003). However, they also inhabit ephemeral creeks, drainages and ponds with minimal riparian and emergent vegetation. California red-legged frogs breed from November to April, although earlier breeding records have been reported in southern localities. Breeding generally occurs in still or slow-moving water often associated with emergent vegetation, such as cattails, tules, or overhanging willows (Storer 1925, Hayes and Jennings 1988). Female frogs deposit egg masses on emergent vegetation so that the egg mass floats on or near the surface of the water (Hayes and Miyamoto 1984).

Habitat includes nearly any area within 1-2 miles of a breeding site that stays moist and cool through the summer including vegetated areas with coyote brush, California blackberry thickets, and root masses associated with willow and California bay trees (Fellers 2005). Sheltering habitat for California red-legged frogs potentially includes all aquatic, riparian, and upland areas within the range of the species and includes any landscape feature that provides cover, such as animal burrows, boulders or rocks, organic debris such as downed trees or logs, and industrial debris. Agricultural features such as drains, watering troughs, spring boxes, abandoned sheds, or hay stacks may also be used. Incised stream channels with portions narrower and depths greater than 18 inches also may provide important summer sheltering habitat. Accessibility to sheltering habitat is essential for the

survival of California red-legged frogs within a watershed, and can be a factor limiting frog population numbers and survival.

California red-legged frogs do not have a distinct breeding migration (Fellers 2005). Adults are often associated with permanent bodies of water. Some individuals remain at breeding sites year-round, while others disperse to neighboring water features. Dispersal distances are typically less than 0.5-mile, with a few individuals moving up to 1-2 miles (Fellers 2005). Movements are typically along riparian corridors, but some individuals, especially on rainy nights, move directly from one site to another through normally inhospitable habitats, such as heavily grazed pastures or oak-grassland savannas (Fellers 2005).

In a study of California red-legged frog terrestrial activity in a mesic area of the Santa Cruz Mountains, Bulger *et al.* (2003) categorized terrestrial use as migratory and non-migratory. The latter occurred from one to several days and was associated with precipitation events. Migratory movements were characterized as the movement between aquatic sites and were most often associated with breeding activities. Bulger *et al.* (2003) reported that non-migrating frogs typically stayed within 200 feet of aquatic habitat 90 percent of the time and were most often associated with dense vegetative cover, *i.e.*, California blackberry, poison oak and coyote brush. Dispersing frogs in northern Santa Cruz County traveled distances from 0.25 mile to more than 2 miles without apparent regard to topography, vegetation type, or riparian corridors (Bulger *et al.* 2003).

In a study of California red-legged frog terrestrial activity in a xeric environment in eastern Contra Costa County, Tatarian (2008) noted that 57 percent of frogs fitted with radio transmitters in the Round Valley study area stayed at their breeding pools, whereas 43 percent moved into adjacent upland habitat or to other aquatic sites. Her study reported a peak seasonal terrestrial movement occurring in the fall months associated with the first 0.2 inch of precipitation and tapering off into spring. Upland movement activities ranged from 3 to 233 feet, averaging 80 feet, and were associated with a variety of refugia including grass thatch, crevices, cow hoof prints, ground squirrel burrows at the base of trees or rocks, logs, and under man-made structures; others were associated with upland sites lacking refugia (Tatarian 2008). The majority of terrestrial movements lasted from 1 to 4 days; however, one adult female was reported to remain in upland habitat for 50 days (Tatarian 2008). Upland refugia closer to aquatic sites were used more often and were more commonly associated with areas exhibiting higher object cover, *e.g.*, woody debris, rocks, and vegetative cover. Subterranean cover was not significantly different between occupied upland habitat and non-occupied upland habitat.

California red-legged frogs are often prolific breeders, laying their eggs during or shortly after large rainfall events in late winter and early spring (Hayes and Miyamoto 1984). Egg masses containing 2,000 - 5,000 eggs are attached to vegetation below the surface and hatch after 6 - 14 days (Storer 1925, Jennings and Hayes 1994). In coastal lagoons, the most significant mortality factor in the pre-hatching stage is water salinity (Jennings *et al.* 1992). Eggs exposed to salinity levels greater than 4.5 parts per thousand resulted in 100 percent mortality (Jennings and Hayes 1990). Increased siltation during the breeding season can cause asphyxiation of eggs and small larvae. Larvae undergo metamorphosis 3.5 - 7 months following hatching and reach sexual maturity at 2 - 3 years of age (Storer 1925; Wright and Wright 1949; Jennings and Hayes 1985, 1990, 1994). Of the various life stages, larvae probably experience the highest mortality rates, with less than 1 percent of eggs laid reaching metamorphosis (Jennings *et al.* 1992). California red-legged frogs may live 8 to 10 years (Jennings *et al.* 1992). Populations can fluctuate from year to year; favorable conditions allow the species to have extremely high rates of reproduction and thus produce large numbers of dispersing

young and a concomitant increase in the number of occupied sites. In contrast, the animal may temporarily disappear from an area when conditions are stressful (*e.g.*, during periods of drought, disease, etc.).

The diet of California red-legged frogs is highly variable and changes with the life history stage. The diet of the larvae is not well studied, but is likely similar to that of other ranid frogs, feeding on algae, diatoms, and detritus by grazing on the surface of rocks and vegetation (Fellers 2005; Kupferberg 1996a, 1996b, 1997). Hayes and Tennant (1985) analyzed the diets of California red-legged frogs from Cañada de la Gaviota in Santa Barbara County during the winter of 1981 and found invertebrates (comprising 42 taxa) to be the most common prey item consumed; however, they speculated that this was opportunistic and varied based on prey availability. They ascertained that larger frogs consumed larger prey and were recorded to have preyed on Pacific chorus frogs, three-spined stickleback, and, to a limited extent, California mice, which were abundant at the study site (Hayes and Tennant 1985, Fellers 2005). Although larger vertebrate prey was consumed less frequently, it represented over half of the prey mass eaten by larger frogs suggesting that such prey may play an energetically important role in their diets (Hayes and Tennant 1985). Juvenile and subadult/adult frogs varied in their feeding activity periods; juveniles fed for longer periods throughout the day and night, while subadult/adults fed nocturnally (Hayes and Tennant 1985). Juveniles were significantly less successful at capturing prey and all life history stages exhibited poor prey discrimination, feeding on several inanimate objects that moved through their field of view (Hayes and Tennant 1985).

Recovery Plan: The recovery plan for the California red-legged frog identifies eight recovery units (Service 2002). The establishment of these recovery units is based on the determination that various regional areas of the species' range are essential to its survival and recovery. The status of the California red-legged frog was considered within the small scale recovery units as opposed to their overall range. These recovery units are delineated by major watershed boundaries as defined by U.S. Geological Survey hydrologic units and the limits of its range. The goal of the recovery plan is to protect the long-term viability of all extant populations within each recovery unit. Within each recovery unit, core areas have been delineated and represent contiguous areas of moderate to high California red-legged frog densities that are relatively free of exotic species such as bullfrogs. The goal of designating core areas is to protect metapopulations. Thus when combined with suitable dispersal habitat, will allow for the long term viability within existing populations. The management strategy identified within the Recovery Plan will allow for the recolonization of habitats within and adjacent to core areas that are naturally subjected to periodic localized extinctions, thus assuring the long-term survival and recovery of California red-legged frogs.

Threats: Habitat loss, non-native species introduction, and urban encroachment are the primary factors that have adversely affected the California red-legged frog throughout its range. Several researchers in central California have noted the decline and eventual local disappearance of California and northern red-legged frogs in systems supporting bullfrogs (Jennings and Hayes 1990, Twedt 1993), red swamp crayfish, signal crayfish, and several species of warm water fish including sunfish, goldfish, common carp, and mosquitofish (Moyle 1976, Barry 1992, Hunt 1993, Fisher and Schaffer 1996). This has been attributed to predation, competition, and reproduction interference. Twedt (1993) documented bullfrog predation of juvenile northern red-legged frogs, and suggested that bullfrogs could prey on subadult California red-legged frogs as well. Bullfrogs may also have a competitive advantage over California red-legged frogs. For instance, bullfrogs are larger and possess more generalized food habits (Bury and Whelan 1984). In addition, bullfrogs have an extended breeding season during which an individual female can produce as many as 20,000 eggs

(Emlen 1977). Furthermore, bullfrog larvae are unpalatable to predatory fish (Kruse and Francis 1977). Bullfrogs also interfere with California red-legged frog reproduction by eating adult male California red-legged frogs. Both California and northern red-legged frogs have been observed in amplexus (mounted on) with both male and female bullfrogs (Jennings and Hayes 1990, Jennings 1993, Twedt 1993). Thus bullfrogs are able to prey upon and out-compete California red-legged frogs, especially in sub-optimal habitat.

The urbanization of land within and adjacent to California red-legged frog habitat has also affected the threatened amphibian. These declines are attributed to channelization of riparian areas, enclosure of the channels by urban development that blocks dispersal, and the introduction of predatory fishes and bullfrogs. Diseases may also pose a significant threat, although the specific effects of disease on the California red-legged frog are not known. Pathogens are suspected of causing global amphibian declines (Davidson *et al.* 2003). Chytridiomycosis and ranaviruses are a potential threat because these diseases have been found to adversely affect other amphibians, including the listed species (Davidson *et al.* 2003; Lips *et al.* 2006). Mao *et al.* (1999 cited in Fellers 2005) reported northern red-legged frogs infected with an iridovirus, which was also presented in sympatric threespine sticklebacks in northwestern California. Non-native species, such as bullfrogs and non-native tiger salamanders that live within the range of the California red-legged frog have been identified as potential carriers of these diseases (Garner *et al.* 2006). Human activities can facilitate the spread of disease by encouraging the further introduction of non-native carriers and by acting as carriers themselves (*i.e.*, contaminated boots, waders or fishing equipment). Human activities can also introduce stress by other means, such as habitat fragmentation, that results in the listed species being more susceptible to the effects of disease.

Alameda Whipsnake

For the most recent comprehensive assessment of the species' range-wide status, please refer to the Alameda whipsnake 5-year Review (Service 2011). No change in the species' listing status was recommended in this 5-year review. Threats evaluated during that review and discussed in the final document have continued to act on the species since the 2011 5-year review was finalized, with loss of habitat being the most significant effect. While there have been continued losses of Alameda whipsnake habitat, to date no project has proposed a level of effects for which the Service has issued a biological opinion of jeopardy for the species. The Service is in the process of finalizing its most current 5-year review for the species.

Environmental Baseline

Location and Setting

The 5,074-acre Reuse Area is located approximately 3.5 miles south of Suisun Bay in the eastern portion of the City of Concord. The Reuse Area is characterized by valley floor and rolling hills with elevations ranging from about 100 feet above sea level to 1,000 feet above sea level along the ridge of the Los Medanos Hills. The Reuse Area is bound on the northeast by the Los Medanos Hills, on the southwest by developed areas of the City of Concord, on the east by rangelands, and on the west by Port Chicago Highway. A site proposed for future development (on the approximately 600-acre Southwest Hills/Faria property) lies on the northeast border of the Reuse Area. The 6,419-acre Tidal Area of the former CNWS station lies to the north of the Reuse Area between SR 4 and Suisun Bay. The Tidal Area was transferred to the United States Army in 2008 and it is now the Military Ocean Terminal Concord (MOTCO) operated by the Army.

The Reuse Area lies adjacent to the inventory area of the ECCC HCP/NCCP with the northeast border of the Reuse area forming the northwestern border of the ECCC HCP/NCCP Inventory Area (Inventory Area). In addition to providing permits for urban development and rural infrastructure projects within the inventory area, the ECC HCP/NCCP prescribes a regional conservation strategy that includes the development and acquisition of a preserve system. A completed preserve system will encompass 23,800 to 30,300 acres of land in eastern Contra Costa County. One goal of the ECCC HCP/NCCP preserve system is to link habitat in the Reuse Area with habitat in the Black Diamond Mines Regional Park to the southeast and to extend this linkage to create a corridor of protected lands reaching to Cowell Ranch and Los Vaqueros Watershed in the southeastern corner of the county. Currently, the ECCC HCP/NCCP preserve system includes over 12,000 acres of protected lands, many of which contribute to this goal, including the approximately 450-acre Land Waste (or Hess) property located along Kirker Pass Road approximately 1,500 feet to the east of the southeastern border of the Reuse Area. Future ECCC HCP/NCCP efforts will work towards preserving additional land that will link ECCC HCP/NCCP preserve properties to the Reuse Area and to create a corridor of preserved lands extending to Black Diamond Mines and further to the east and south.

Historical Uses

The Reuse Area is a former munitions storage and shipping facility that was created in the 1940's and recommended for closure by the Base Realignment and Closure Commission in 2005. During active military use, operational facilities included high-explosive and gun magazines or storage bunkers, military barracks, and a weapons laboratory. The Navy also constructed a rail system and two air runways on the site. Networks of roads, railroads, and utilities link the buildings across the site. The highest concentration of former Navy administration buildings is located north of SR 4. Navy facilities in the remainder of Reuse Area include primarily storage bunkers, railroad tracks, and roads, many of which are widely spaced and interspersed with grassland and other natural habitats. The main concentration of bunkers (known as Bunker City) is located between Willow Pass Road and Bailey Road to the west of Mt. Diablo Creek. An abandoned concrete runway (the old airfield) is located in the area bordered by Willow Pass Road and Olivera Road. The Inland Area of the CNWS has been inactive since 1999 and the Reuse Area has been exposed to relatively little direct human activity in recent decades. Extensive fencing exists along the perimeter of the site and the Reuse Area is not currently accessible to the public.

The Navy has been performing CERCLA remediation and restoration activities in the Reuse Area since 1982 when it performed an initial assessment to identify areas of contamination. The Navy completed a site investigation in 1993 and in 1994, the Navy entered into an agreement with the U.S. and California Environmental Protection Agencies that identified areas of contamination and established goals, responsibilities, and schedules for clean-up of the sites. CERCLA remediation work locations generally correspond with Parcels for Later Transfer in Figure 4.

Habitats

Major habitat types within the Reuse Area include California annual grassland; coyote brush scrub/coastal sage scrub; oak woodland/savannah; orchards and plantations; seasonal and perennial wetlands; creeks, drainages, canals, and ponds; and riparian woodland (see Table 5 in the *Description of the Proposed Action* section above for acreages and Figure 2 for locations).

The vast majority of the Reuse Area supports California annual grassland with wetland and riparian habitats occurring as narrow bands or discrete features. The annual grasslands are dominated by non-native annuals, including wild oats, ripgut grass, and Italian ryegrass. However, remnant stands of native perennial grasslands remain, in particular on steeper slopes of the Los Medanos Hills. Yellow star thistle and other invasive weeds comprise a significant portion of the vegetation in many locations and recent observations indicate that noxious weed populations in the Reuse Area are expanding.

Mt. Diablo Creek, which crosses the site from south to north, is the major hydrologic feature of the site, receiving runoff from over 75 percent of the Reuse Area. The greatest flow levels in this creek occur during heavy rainstorms in the winter months, and the creek dries in many reaches during the late spring, summer, and fall months. Flows in Willow Pass Creek, which enters the Reuse Area near the SR 4 overpass of Willow Pass Road, are flashy with flows corresponding with high rainfall amounts and then quickly diminishing. However, spring-fed perennial pools are present within Willow Pass Creek.

Woody riparian vegetation occurs along Mt. Diablo Creek, along Willow Pass Creek and its alluvial fan, and in two areas located south of the airfield. Riparian vegetation along Mt. Diablo Creek is dominated by a variety of trees and shrubs, including red willow, arroyo willow, Fremont cottonwood, California buckeye, California black walnut, and Oregon ash. Due to a heavy overstory of trees and shrubs along most of its length, and variable water flows within the creek, very little wetland vegetation grows below the top-of-bank of the creek. Riparian vegetation associated with Willow Pass Creek is largely comprised of a narrow, poorly developed riparian corridor supporting small trees and shrubs located in and directly adjacent to the deeply incised banks of the stream.

The majority of oak woodland in the Reuse Area occurs in the form of small, clustered pockets of trees occurring on more mesic sites within the larger oak savannah/grassland. Typical oak species on the site are coast live oak, blue oak, and valley oak. Scattered California buckeye trees represent a subdominant species of the oak woodlands in some of the deeper and more protected drainages within the Los Medanos Hills. The valley oak, coast live oak, and buckeye form closed canopies within the oak woodland communities in some of the ephemeral drainages on the site, with forbs such as miner's lettuce, common chickweed, and shepherd's purse forming the understory.

Shrub-dominated plant communities occur at two sites in the Reuse Area. A stand of coastal sage scrub is located on the northwest-facing slope within Rattlesnake Canyon in the southeast corner of the site. The second is a mature stand of coyote brush located near the old airfield.

The Reuse Area also contains remnant orchards and plantations planted prior to its use for military purposes. During the late 1800s, eucalyptus groves were planted by homesteaders. Later, the University of California Cooperative Extension planted test groves of eucalyptus to evaluate the cost of eucalyptus energy production. In addition, the U.S. Forest Service maintained several plantations consisting of test plantings of pine and blue gum eucalyptus. Each plantation contains several hundred trees; however the plots are no longer maintained. Abandoned walnut orchards are also present north and south of Bunker City.

The Reuse Area includes ten named ponds (Figure 8) as well as a number of smaller unnamed features that support seasonal ponding. Most of the named ponds also dry seasonally. However, Cistern Pond and, in most years, Upper Indian Springs Pond are perennial. The golf course also includes a number of perennial ponds that are supported with supplemental water.

Freshwater marsh is present at the Cistern Pond, portions of the Contra Costa Canal, two areas near the old airfield, and in a linear ditch that extends along the site boundary just south of the old airfield. The freshwater marsh near the old airfield is associated with a system that includes a perennial spring and permanent water that drains off-site to the west. Although the floristic composition of these freshwater marshes is variable, typical dominant species include bulrush, cattails, sedges, and Baltic rush.

Seasonal wetlands in the Reuse Area include natural channels, two wetland areas near the old airfield, wetlands within and adjacent to Willow Pass Creek, within portions of man-made ditches near Bunker City, along the railroad line in the northwest section of the site near Mt. Diablo Creek, around the perimeter of seasonal stock ponds, and in numerous shallow depressions within the annual grasslands. The majority of seasonal wetlands on the site support primarily marginal wetland grass species such as Italian ryegrass and Mediterranean barley, as well as bristly ox-tongue and bird's-foot trefoil. The largest seasonal wetlands on the site consist of two patches near the old airfield, an area that has been highly disturbed by the diversion of Mt. Diablo Creek at least a century ago. These seasonal wetlands are supported by a combination of rainfall and a deeper seep that maintains high levels of soil moisture well into the summer.

Portions of the Contra Costa Canal and the Clayton Canal extend generally in a north-south direction bisecting the Reuse Area. Both canals are part of the Bureau of Reclamation's California Central Valley Project. The Contra Costa Canal enters the northwest section of the site and exits in the southwest corner, crossing Willow Pass Road. The north end of the Clayton Canal begins on the site as an aqueduct connected to the east side of the Contra Costa Canal in the northeast portion of the site, extending south where it exits the west-central portion of the site. The Clayton Canal is currently inactive, having not been used to convey water for more than 20 years, while the Contra Costa Canal only conveys water part of the year.

Developed areas include roadways, rail lines, parking lots, runways, railroad yards, and a wide variety of structures, including buildings, bridges, and bunkers. The Magazine Area, also referred to as Bunker City, largely corresponds with IR-site 22. This area contains the majority of the formerly used ammunition storage bunkers and includes associated rail line, loading docks, asphalt roadways, and concrete aprons. The tops of these bunkers are covered with soil and a plant community similar in structure and composition to the adjacent grasslands, and as such, the tops of the bunker structures are considered California annual grassland.

Central California Tiger Salamander

The occurrence of Central California tiger salamanders within the Reuse Area has been documented during various surveys including: natural resource and wildlife surveys of the Tidal and Inland Areas of the CNWS conducted from 1981-1982 (Jones and Stokes 1982); surveys for amphibians and reptiles conducted from 1998-1999 (Downard et al. 1999); surveys conducted for Central California tiger salamander and California red-legged frog in spring of 2005 and 2006 (Smallwood and Morrison 2007); and larval surveys for Central California tiger salamander conducted in 2011 (H.T. Harvey & Associates 2011). Based on these surveys, Central California tiger salamander breeding has been detected at the following ponds within the Reuse Area (see Figure 8 for pond locations): Upper and Lower Cistern Ponds; Rock Quarry Pond; 5AT-1 Pond; 5AT-2 Pond; Rattlesnake Canyon Pond; Lower Indian Springs Pond; and North and south Hilltop Ponds. Central California tiger salamanders have also been detected in ditches south of Bailey Road, in a pool alongside a railway track just north of Bailey Road, and within a seasonal pool in a ditch within Bunker City. Central

California tiger salamander eggs have been observed within the Clayton Canal near the IA-100 sites in an area which regularly pools water during the rainy season. Because the canal is inactive and does not actively flow, it potentially provides suitable breeding habitat.

In addition, per the 2012 biological opinion for the Navy's hazardous materials investigation and remediation activities in the Reuse Area, the Navy has been conducting trapping for Central California tiger salamanders at various CERCLA remediation sites (trapping locations correspond with Parcels for Later Transfer in Figure 4). Central California tiger salamanders have been found at the following locations: Eagle's Nest, Site 24A, IA-100 sites, Rocket Practice Area, and Bermed Area. Based on Navy trapping efforts and survey data, the Eagle's Nest area within the EBPRD PBC Area appears to support high concentrations of Central California tiger salamanders. Out of a total of 652 individual Central California tiger salamanders trapped across all Navy trapping locations between October 2010 and March 2016, 605 of these individuals were trapped at Eagle's Nest (Condor Country 2016). Larval surveys also found the highest concentrations of Central California tiger salamander larvae in the Hilltop Ponds near the Eagles Nest trapping site, with the next highest concentrations found in breeding ponds south of Bailey Road (Smallwood and Morrison 2007). In a study conducted on an approximately 67-acre study site located just outside the eastern border of the Reuse Area North of Bailey Road, trapping for Central California tiger salamanders conducted between October 2000 and April 2005 trapped between 90 and 417 Central California tiger salamanders annually (Orloff 2011). The study concluded that the Hilltop Ponds in the Reuse Area were the most likely breeding source for the salamanders trapped during the study despite being located over 800 meters away. Given the high numbers of Central California tiger salamanders trapped in uplands surrounding the Hilltop Ponds(both within and outside of the Reuse Area), it appears that these ponds provide important breeding habitat that supports a robust population of Central California tiger salamanders.

In contrast, detections of Central California tiger salamanders within the Reuse Area west of Mt. Diablo Creek have been scarce with only one documented occurrence (in 2006) from a pool in the Bunker City area (CNDDB 2016). As described above, a number of survey efforts have been undertaken, dating back to 1981, to determine the locations of Central California tiger salamanders in portions of the Reuse Area (Jones and Stokes 1982, Downard et al. 1999, Smallwood and Morrison 2007, H.T. Harvey & Associates 2011, and Condor Country 2016), yet except for the 2006 record from Bunker City, Central California tiger salamanders have not been recorded in the northwest portion of the Reuse Area (i.e. within the EDC Area). These survey efforts consisted primarily of larval aquatic surveys, although Smallwood and Morrison (2007) conducted upland trapping surveys in selected areas and Condor Country conducted upland trapping in multiple years (Condor Country 2016) to remove Central California tiger salamanders from CERCLA remediation sites (trapping locations correspond with Parcels for Later Transfer in Figure 4). Despite these survey efforts, the closest records of Central California tiger salamanders to Willow Pass Road are 1.38 miles southeast of Willow Pass Road on the east side of Mt. Diablo Creek and 1.40 miles south of Willow Pass Road on the west side of Mt. Diablo Creek. The reasons for the lack of detections in this area are not clear although the high banks of Mt. Diablo Creek and the railroad tracks that parallel the creek could act as impediments to dispersal of Central California tiger salamanders into this area. There are no stock ponds in this area; however, a small number of seasonal pools (typically located in shallow depressions or in drainage ditches along roads and rail lines) appear to hold water for an adequate period of time to support Central California tiger salamander breeding. The perennial spring near the old airfield also provides potential aquatic breeding habitat.

Although the lack of detections suggests that the habitat for Central California tiger salamanders in this portion of the Reuse Area is of a lower quality, it does not necessarily indicate that Central California tiger salamanders are absent from this area. Multiple studies of Central California tiger salamanders have shown large fluctuations in breeding between years (Bobzien and DiDonato 2007, Service 2016) and Central California salamanders can spend multiple years residing in upland habitat without emerging from underground refugia to migrate to aquatic habitat to breed (Orloff 2011). Alvarez surveyed 90 ponds in Contra Costa County for nine years and reported that only one pond had breeding observed every year, and the most breeding observed in a single year was in 44 ponds (Service 2016). The average interval between California tiger salamanders breeding at a pond was 3 years (Service 2016). This pattern of sporadic breeding and emergence from underground refugia makes the detection of Central California tiger salamanders that may be present in an area difficult.

As a whole, the Reuse Area provides a large area of contiguous habitat where a mosaic of upland and aquatic habitat provides breeding, dispersal, foraging, and sheltering habitat for the Central California tiger salamander. Portions of the Reuse Area support high densities of Central California tiger salamanders and provide important breeding habitat for Central California tiger salamanders in the Reuse Area and surrounding areas. The Reuse Area is also contiguous with other natural lands that provide upland and aquatic breeding habitat for Central California tiger salamanders and that are known to support Central California tiger salamander (CDFW 2016). While some of these lands are proposed for future development, others have been preserved. As such, the Reuse Area plays a role in supporting Central California tiger salamander populations and dispersal in the Reuse Area and vicinity.

Current threats to Central California tiger salamanders in the Reuse Area include: habitat modification and degradation and harm and harassment from remediation and maintenance activities; competition and predation by introduced species and/or feral animals; and injury or mortality from vehicle strikes. Existing rail lines as well as the Contra Costa Canal may act as barriers to Central California tiger salamander movement in the Reuse Area and could limit or prevent access to breeding habitat (Bartoszek and Greenwald 2009). In addition, development of habitat adjacent to the Reuse Area could result in adverse effects to the population of Central California tiger salamander that use the Hilltop Ponds for breeding.

California Red-legged frog

The proposed project is located in the East San Francisco Bay Core Area of the East San Francisco Bay Recovery Unit for the California red-legged frog (Service 2002). This Recovery Unit extends from the northernmost portion of Contra Costa County including a portion of San Joaquin County, south to Santa Clara County, and includes the eastern portion of San Mateo County, and all of San Francisco County. Within this Recovery Unit, California red-legged frogs appear to have been largely eliminated from the western lowland areas near urbanization. However, isolated populations occur in the East Bay foothills (between Interstate 580 and Interstate 680) and the species is abundant in several areas in eastern Alameda and Contra Costa counties. This Recovery Unit is essential to the survival and recovery of California red-legged frog, as it contains the largest number of occupied drainages in the northern portion of the species' range.

During the surveys described above in the baseline for Central California tiger salamander, California red-legged frogs were detected at the following ponds in the Reuse Area: Upper and Lower Cistern Pond, Upper and Lower Indian Springs Ponds, 5AT-1 Pond, Rattlesnake Canyon Pond, and 5AT-2 Pond. California red-legged frogs were also detected along dirt roads between

Cistern Pond and Indian Springs during evening spotlight surveys and in grassland habitat west of Mt. Diablo Creek. During Central California tiger salamander trapping conducted by the Navy at CERCLA sites, one California red-legged frog was trapped at the Rocket Practice Area site and one California red-legged frog was found along trapline fencing at the Eagles Nest site. California red-legged frogs have also been detected in several locations along Mt. Diablo Creek. Although California red-legged frog breeding has not been documented in Mt. Diablo Creek, the creek provides aquatic non-breeding habitat including some pools that last into the summer months and likely provides important habitat for California red-legged frogs in the Reuse Area.

Based on survey results, Cistern Pond appears to support the most robust population of California red-legged frogs in the Reuse Area. However, various surveys noted that vegetation encroachment at Cistern pond was leading to less open water and potentially reducing the quality of habitat for California red-legged frogs. In fall of 2016, the Navy conducted a pond enhancement project at Cistern Pond; dense vegetation was removed and a portion of the pond was deepened. During the pond enhancement work, more than 250 California red-legged frogs were detected and moved out of the work area, and then allowed to return once work was completed. The pond enhancement resulted in increased open water habitat for California red-legged frogs at Cistern Pond.

Surveys conducted in 2005 and 2006 did not detect California red-legged frogs in Rattlesnake Pond or Indian Springs Ponds and noted these ponds appeared to have dried substantially since the surveys conducted in 1999 (Smallwood and Morrison 2007). Work to increase ponding duration may be needed in order for these ponds to continue to provide suitable breeding habitat for California red-legged frog. Although freshwater marsh in the old runway area and golf course ponds could potentially provide habitat for California red-legged frogs, no California red-legged frogs have been observed in these locations and non-native predatory species (i.e. bullfrogs, crayfish and mosquitofish) are known to occur in these features, diminishing their value to California red-legged frogs.

Various surveys have documented the presence of bullfrogs in the Reuse Area. Studies conducted in the 1980s expressed concern with the presence of bullfrogs at Cistern Pond that could negatively impact the California red-legged frog population. However, surveys conducted in 1999 detected only a single bullfrog within the pond and only one bullfrog was found (and subsequently dispatched) during the Cistern Pond enhancement project. Bullfrogs have been detected in several locations along Diablo Creek. Although the presence of bullfrogs can diminish the quality of habitat for California red-legged frogs, the California red-legged frog population in the Reuse Area does not appear to have been substantially affected by the presence of bullfrogs at this time.

As a whole, the Reuse Area provides a large area of contiguous habitat where a mosaic of upland and aquatic habitat provides breeding, dispersal, foraging, and sheltering habitat for the California red-legged frog. The Reuse Area is also contiguous with other natural lands that provide upland and aquatic breeding habitat for California red-legged frog. While some of these lands are proposed for future development, others have been preserved. As such, the Reuse Area also plays a role in supporting larger California red-legged frog dispersal movements.

Current threats to California red-legged frogs in the Reuse Area include: habitat modification and degradation and harm and harassment from remediation and maintenance activities; competition and predation by introduced species and/or feral animals; and injury or mortality from vehicle strikes.

Alameda Whipsnake

The Reuse Area is located approximately 2 miles to the northeast of the Mt Diablo-Black Hills Recovery Unit and Critical Habitat Unit for Alameda whipsnake. The Mt. Diablo-Black Hills Critical Habitat Unit is thought to provide some of the highest quality and largest contiguous block of habitat for Alameda whipsnake and to support one of the most robust populations (Service 2006a).

There are no documented occurrences of Alameda whipsnake within the Reuse Area. However, Alameda whipsnakes have been documented less than 3 miles to the south and to the southeast of the Reuse Area (CDFW 2016). Within the Reuse Area south of Bailey Road, small patches of scrub habitat in upper Rattlesnake Canyon and grassland with rock outcrops provide potential habitat for Alameda whipsnake. Although the small patches of scrub habitat in the Reuse Area may not be adequate to support a population of Alameda whipsnake, extensive stands of scrub habitat with rock outcrops adequate to support Alameda whipsnake populations are located close enough to the Reuse Area to result in habitat within the Reuse Area being used by Alameda whipsnakes during dispersal. Alameda whipsnake habitat in the Reuse Area is likely limited to the portion of the Reuse Area south of Bailey Road.

Effects of the Action

California Red-Legged Frog and Central California Tiger Salamander

The proposed project will result in temporary and permanent effects to habitat for Central California tiger salamander and California red-legged frog. This could result in individuals being directly and/or indirectly affected. The proposed project could (1) reduce and fragment the amount of habitat available to Central California tiger salamander and California red-legged frog in the area; (2) result in the injury and death of individual Central California tiger salamanders and California red-legged frogs; and (3) result in non-lethal harm and harassment of surviving individuals.

Habitat Loss and Fragmentation

Implementation of the Area Plan will result in development or redevelopment of 2,369 acres of the 5,074-acre Reuse Area that lie outside the EBRPD PBC Area (2,516 acres) and the Mt. Diablo Creek Riparian Corridor (189 acres). Of these 2,369 acres, 562 acres are already developed including: 76 acres in the County PBC Area north of State Route 4; 85 acres within Olivera Field and the portion of the existing golf course to be transferred from the Navy to the City; 68 acres within the City-owned portion of the golf course; 24 acres within the BART parcel; 8 acres within right-of-ways where road improvements will occur; 16 acres within the EDC Area along Kinne Boulevard, between the golf course and County PBC; and 285 acres within the EDC Area south of State Route 4 developed with buildings, roads, parking areas, railroad tracks and bunkers. The remaining 1,807 acres of undeveloped habitat will be converted to developed uses. Within the EBRPD PBC Area, development of the Concord Hills Regional Park will result in the development or redevelopment of an additional 85 acres, of which 16.5 acres is habitat for Central California tiger salamander and California red-legged frog. In total, this will result in approximately 1,824 acres of habitat for Central California tiger salamander and California red-legged frog being permanently converted to developed uses. This loss of habitat will occur in phases over a period of approximately 35 years.

The proposed project will extend City of Concord residential and commercial development to the northeast, significantly reducing the amount of upland habitat for Central California tiger salamander

and California red-legged frog between Kirker Pass Road and State Route 4 and reducing and narrowing the amount of habitat that lies between the City of Concord and existing and future development within the City of Pittsburg. Proposed development within the EDC Area will result in the loss of seasonal pools that could potentially provide aquatic breeding habitat for Central California tiger salamander in years with adequate rainfall, although these pools may provide only low quality breeding habitat. Only one seasonal pool (within the Bunker City area) with documented presence of Central California tiger salamander will be lost to development. The proposed development will not result in the loss of any documented breeding habitat for California red-legged frog.

The loss of over 1,800 acres of habitat and individuals inhabiting this area (see *Mortality, Injury, Harm and Harassment* section below) could result in declines in local populations of Central California tiger salamander and California red-legged frog. Smaller populations, particularly if they are isolated from larger populations, are more susceptible to extirpation from random demographic, environmental, and/or genetic events (Shaffer 1987, Lande 1988, Primack 1993). In addition, the quality of habitat remaining within the EBRPD PBC Area may decline as smaller habitat blocks, with a higher the edge to interior ratio, tend to be more vulnerable to outside influences such as those associated with residential development and human presence (Primack 1993) (see *Indirect Effects* section below for a discussion of effects to remaining habitat).

To reduce the effects of habitat loss on Central California tiger salamander and California red-legged frog, proposed EDC development (with the exception of the water tank area) is located in the portion of the Reuse Area that appears to provide the lowest quality habitat for Central California tiger salamander and California red-legged frog and that has the fewest documented occurrences of Central California tiger salamander and California red-legged frog. In contrast, habitat within the EBRPD PBC Area, which will be preserved and managed for listed species in order to partially offset project-related impacts (while also allowing for recreational use), represents the highest quality breeding and upland habitat for Central California tiger salamander and California red-legged frog in the Reuse Area, and with the exception of the seasonal pool in Bunker City, includes all documented breeding habitat for Central California tiger salamander and all documented breeding habitat for California red-legged frog within the Reuse Area.

In addition, work will be conducted to improve the quality of habitat within the EBRPD PBC Area. The implementation of a Service-approved habitat mitigation plan (see Conservation Measure 5 in the *Description of the Proposed Action* section above) will result in the creation of additional breeding ponds for Central California tiger salamander and California red-legged frog and the enhancement/restoration of existing ponds. The removal of rail lines (see Conservation Measure 8f in the *Description of the Proposed Action* section above) will remove potential barriers to Central California tiger salamander movement between breeding ponds and between upland habitat and breeding ponds. These enhancement/restoration activities will occur gradually and will be phased in accordance with phases of development.

The EBRPD PBC Area will be preserved and managed according to a Service-approved long-term management plan (see Conservation Measure 4c in the *Description of the Proposed Action* section above) that will balance recreational uses with preservation of habitat for Central California tiger salamander and California red-legged frog (see the *Indirect Effects* section below for a discussion of the effects of recreation in the EBRPD PBC Area). Not only does the EBRPD PBC Area itself represent a sizeable block of habitat for Central California tiger salamanders and California red-legged frogs, it is contiguous with high-priority conservation areas identified in the ECCC HCP/NCCP and will

preserve habitat that will support the formation of habitat linkages described in the ECCC HCP/NCCP.

The City will also preserve compensatory habitat off-site but within the ECCC HCP/NCCP Inventory Area or the remainder of the Mt. Diablo Creek watershed (see Conservation Measure 6 in the *Description of the Proposed Action* section above) to help offset project impacts. This habitat will be preserved in phases corresponding with phases of development over the next 35 years. Ultimately, up to approximately 1,235 acres of off-site habitat will be preserved when development of the Reuse Area is completed. This compensatory habitat is intended to minimize the effects of the proposed project's anticipated effects to listed species resulting from the permanent loss and degradation of habitat. The off-site compensatory lands will provide suitable habitat for breeding, feeding, or sheltering commensurate with or better than habitat lost as a result of the proposed project. It is anticipated that these lands will complement the ECCC HCP/NCCP preserve system and result in large contiguous blocks of preserved land that will be managed to benefit listed species in perpetuity will contribute to regional recovery efforts for these species.

Temporary Habitat Disturbance

Activities that will result in limited temporary disturbance of habitat (outside of the Mt. Diablo Riparian Corridor which is discussed separately below) include: installation of water tanks and an associated pipeline (8 acres of temporary impact); pre-engineering activities (<10 acres on lands that will be subsequently be converted to developed uses); habitat enhancement and creation within the EBRPD PBC area (up to 8 acres); habitat maintenance activities as prescribed in the Service-approved Long Term Management Plan for the EBRPD PBC Area (acreage of habitat disturbance will be minimal but will include periodic maintenance of ponds and pond banks and berms); and restoration of existing facilities within the EBPRD PBC area (acreage of habitat disturbance is expected to be minimal as restoration work will occur mainly within the footprint of developed facilities). The implementation of CERCLA remediation activities within IR Site 22 may also result in temporary impacts to up to 531 acres if remediation activities are not timed to happen in conjunction with redevelopment construction; however, this area will ultimately be converted to development and as such, for the purposed of this effects analysis is considered to be permanently impacted. Construction of wetlands near the old airfield may also result in up to 20 acres of temporary habitat disturbance. However, since this area will be completely surrounded by EDC development, it will no longer provide suitable habitat for Central California tiger or California red-legged frog and therefore is also included in the acreage of habitat permanently developed.

Temporary disturbance or loss of habitat could result in injury or mortality to any Central California tiger salamanders or California red-legged frogs present (see *Mortality, Injury, Harm and Harassment* section below*)* and cause individual Central California tiger salamanders and California red-legged frogs in and near construction activities to vacate the area. Displaced California red-legged frogs and California tiger salamanders will be subject to increased potential for predation, desiccation, and their ability to find required resources such as food and shelter will be reduced as they move. Although habitat enhancement and maintenance activities will cause temporary habitat disturbance that may adversely affect Central California tiger salamander and California red-legged frog, these activities will ultimately be beneficial by improving and maintaining habitat for these species.

Riparian Corridor

Approximately 2 miles of the Mt. Diablo Riparian Corridor (from State Route 4 to the southern extent of the tournament sports facility/park) will ultimately be bordered on either side by EDC Area development. As a result, the approximately 69 acres of creek and riparian habitat within this segment of the riparian corridor will be isolated from adjacent upland habitat and Central California tiger salamander and California red-legged frog dispersal to this area will be impeded. In addition, individuals that inhabit this creek segment may have lower survivorship as a result of adverse effects associated with being in close proximity to and surrounded by urban development (see *Indirect Effects* section below). Because this 69-acre portion of the Mt. Diablo Riparian Corridor will likely cease to function as suitable habitat for Central California tiger salamanders and California red-legged frogs, this 69 acres will be permanently affected following completion of adjacent development.

In addition, a number of elements of the proposed project will result in temporary effects to habitat within the Mt. Diablo Riparian Corridor. These effects will primarily be associated with the removal and construction of stream crossings and with the implementation of a Riparian Enhancement and Management Plan (see Conservation Measure 7 in the *Description of the Proposed Action* section above). Temporary disturbance of habitat within the creek channel itself will result from installation of three boulder step-pool grade control structures and one energy dissipation structure just downstream of Bailey Road; the installation of 20 buried grade control structures composed of ungrouted boulders, logs, and root wads; and grading to increase sinuosity in the channel and create secondary channels. It is anticipated that this work will result in disturbance of less than 1 acre of creek channel. An additional 25 acres of temporary disturbance within the riparian corridor will result from the removal of 14 existing culverts and the construction of nine new crossings.

Temporary disturbance of habitat within the Mt. Diablo Riparian Corridor but outside of the creek channel will result from grading to stabilize eroding banks, facilitate flood conveyance, and restore/enhance habitat. A maximum of 112 acres within the riparian corridor will be temporarily disturbed by these activities. Grading designs will avoid impacts to native riparian habitat where feasible, and of the 28.6 acres of woody riparian vegetation within the riparian corridor, it is anticipated that only approximately 4 acres will be affected by grading activities.

Despite the disturbance of habitat within the Mt. Diablo Riparian Corridor, it is anticipated that, overall, the implementation of the Riparian Enhancement and Management Plan and the removal and construction of new stream crossings will ultimately result in better quality habitat within the 120 acres of the riparian corridor that are not bordered on either side by the EDC Area. In-channel work and the removal and replacement of stream crossings will improve habitat conditions by reducing channel erosion, removing hardscape, and creating tie-ins to new secondary channels. Most existing stream crossings are culverts with concrete or other artificial materials forming the channel bottom and banks. These crossings will be replaced with free-span bridges that will preserve a natural channel bottom; concrete box culverts will be replaced with an earthen channel design. The net effect of reducing the number of crossings and replacing existing crossings with free-span and natural bottomed creek crossings will result in improved quality of stream habitat and better connectivity for wildlife movement within the stream channel. Increased complexity created by grade control structures will improve structural heterogeneity and will provide seasonally inundated pools that retain water longer. Greater habitat complexity will provide more varied foraging opportunities and refugia habitat for California red-legged frogs. The creation of pools will increase the amount of aquatic habitat available later in the dry season and potentially provide pools more conducive to California red-legged frog breeding.

Work outside the stream channel will widen the riparian corridor and create a greater diversity of habitats. Following grading activities, the floodplains created by laying back steep eroding slopes will be revegetated with riparian vegetation to create a wider corridor of riparian habitat that will support a more diverse assemblage of habitats. Up to an additional 80 acres of riparian habitat may be established within the riparian corridor. In addition, approximately 2.5 acres of invasive plants will be removed and 70 cubic yards of trash and debris will be removed. A wider and more complex corridor of riparian habitat could provide increased foraging and refugia opportunities for California red-legged frog adjacent to the creek channel. A more robust riparian corridor could also facilitate California red-legged frog dispersal within the Riparian Corridor.

Mortality, Injury, Harm and Harassment

The use of large and small construction equipment to conduct work in upland habitat for Central California tiger salamander and California red-legged frog could disturb, collapse, or crush animal burrows resulting in injury or mortality to any Central California tiger salamanders or California red-legged frogs present. Construction traffic in work areas and between work areas may also result in injury and mortality of individuals due to vehicle strike. Vibration, dust, noise, contaminants (i.e. fuel leaks), and lighting associated with use of construction equipment could cause individuals in and near construction activities to vacate the area. Displaced Central California tiger salamanders or California red-legged frogs will be subject to increased potential for predation, desiccation, and their ability to find required resources such as food and shelter will be reduced as they move. The following activities will require the use of small and/or large construction equipment: the construction of residential, commercial and recreational development and associated facilities in the EDC Area; the implementation of CERCLA remediation activities within IR Site 22; the construction of recreational facilities in the EBRPD PBC Area; the removal and construction of creek crossings; trail construction and creek restoration and flood conveyance work within the Mt. Diablo Riparian Corridor; construction of wetlands within the EDC Area and Mt. Diablo Riparian Corridor; habitat restoration, enhancement, and creation within the EBRPD PBC area; and habitat maintenance activities, as prescribed in a Service-approved Long Term Management Plan (see Conservation Measure 4c in the *Description of the Proposed Action* section above), including pond maintenance and repair and restoration of existing facilities within the EBPRD PBC area.

Work within Mt. Diablo Creek (i.e. stream crossings, installation of the pipeline to the water tower, stream/riparian restoration) could result in injury or mortality to any California red-legged frogs present in the creek. California red-legged frogs could also be injured or killed if they become entrained or trapped in pumps used for dewatering a work area or stranded within the dewatered work area. In addition, work could result in the temporary reduction in water quality in Mt. Diablo Creek. Increased turbidity or hazardous substances from leaking equipment or uncured concrete could result in decreased water quality. Reduced water quality could result in mortality (in the case of uncured concrete) or reduced reproductive success, prey availability, and foraging success of California red-legged frogs. Contaminated equipment and workers could also introduce or spread nonnative invasive plant species, which would diminish habitat quality.

In order to minimize the amount of injury and mortality to Central California tiger salamanders and California red-legged frogs resulting from construction activities, a number of avoidance and minimization measures will be implemented (see Conservation Measure 9 in the *Description of the Proposed Action* section above). Wildlife exclusion fencing will be installed around work areas to prevent amphibians from entering the construction area. Wildlife exclusion fencing will include

escape ramps or funnels that will allow Central California tiger salamanders and California red-legged frogs within the work area to leave but not enter the development area. Wildlife exclusion fencing will be monitored for any Central California tiger salamanders or California red-legged frogs stranded along the fenceline and any stranded individuals will be relocated according to a Service-approved relocation plan. In addition, conducting awareness training for employees, conducting preconstruction surveys for listed species, having a Service-approved biologist present at work sites to prevent injury to individuals and move them to a safe location, and limitations on nighttime work and work during the wet season will minimize injury and mortality to Central California tiger salamanders. Implementing BMPs for erosion control, restricting maintenance and fueling of vehicles and equipment to designated areas, ensuring that creek water does not come in contact with uncured concrete, having a Service-approved biologist present during work in the creek, and properly screening pump intakes will minimize injury and mortality of Central California tiger salamander and California red-legged frog during work in the Mt. Diablo Riparian Corridor.

Although preconstruction surveys and the presence of on-site biological monitors will reduce the likelihood of injury of Central California tiger salamander and California red-legged frogs, capturing and handling frogs and salamanders to remove them from a work area may result in the harassment, injury, or mortality of individuals. Stress, injury, and mortality may occur as a result of improper handling, containment, and transport of individuals. Death and injury of individuals could occur at the time of relocation or later in time subsequent to their release. Although survivorship for translocated California tiger salamanders or California red-legged frogs has not been estimated, survivorship of translocated wildlife, in general, is lower because of intraspecific competition, lack of familiarity with the location of potential breeding, feeding, and sheltering habitats, and increased risk of predation. Improper handling, containment, or transport of individuals will be reduced or prevented by use of Service-approved biologists.

Indirect Effects

The biological integrity of habitat adjoining developed areas can be diminished by indirect effects associated with the developed area that take place following development and extend beyond the development footprint after development is completed. Development of the EDC Area as well as increased human presence and recreational use of the EBRPD PBC Area and the Mt. Diablo Riparian Corridor will result in indirect effects that will likely diminish the quality of habitat within the EBPRD PBC area and the riparian corridor and may result in harm, harassment, injury or death of Central California tiger salamanders and California red-legged frogs. Indirect effects could result from: increased human disturbance, increased levels of noise and lighting, increased numbers of urban-adapted predators (e.g. skunks and raccoons), increased numbers of domestic predators (e.g. dogs and cats), and increased vehicle-related disturbance and vehicle strikes. Increased human presence could also facilitate other indirect effects such as the spread of disease and non-native invasive species and increased risk of wildfire. These indirect effects will likely be greatest in habitat near the boundary of EDC Area and in areas with more intense recreational use within the EBRPD PBC area (i.e. group picnic sites, parking areas, and the Port Chicago monument and visitor center).

The increased presence of people and dogs in the Mt. Diablo Riparian Corridor and the EBRPD PBC Area may affect Central California tiger salamanders and California red-legged frogs by trampling habitat and disturbing individual animals, potentially creating a level of disturbance that could cause Central California tiger salamanders or California red-legged frogs to avoid or abandon previously occupied habitat (Taylor and Knight 2003). House cats or feral cats that stray into the riparian corridor or EBRPD PBC Area and stray dogs or dogs accompanying recreationists could

kill or injure Central California tiger salamanders or California red-legged frogs. Trash and discarded food items could result in increased numbers of urban adapted predators such as skunks, raccoons, and ravens leading to increased predation of Central California tiger salamanders and California red-legged frogs. One study found that a population of wood turtles in a wildlife preserve closed to recreational use steadily declined and was eventually extirpated following opening the preserve to recreational use. Based on observations by the researchers, the study hypothesized that the decline was likely related to increased predation resulting from an increase in predators associated with increased garbage (Garber and Burger 1995). Within the EBRPD PBC Area, trash and discarded food will likely be most problematic at sites such as group picnic sites, parking areas, at the Port Chicago monument and visitor center, and along trails within the riparian corridor where the most intense recreational use will occur.

Increased traffic on existing roads adjacent to and/or within EBPRD PBC Area and the riparian corridor could result in increased risk of injury or mortality of Central California tiger salamanders and California red-legged frogs due to vehicle strikes; this risk is highest on roads that Central California tiger salamanders or California red-legged frogs are likely to cross during migrations to and from breeding habitat (for example on roads in the EBRPD PBC Area that are located between breeding ponds and the riparian corridor). However, because both Central California tiger salamanders and California red-legged frogs migrate primarily on rainy nights, and normal park hours will be limited to between dawn and dusk, the threat of vehicle strikes will be reduced.

Increased nighttime lighting within the EDC Area could potentially attract Central California tiger salamanders or California red-legged frogs into the development area and/or increase the chance they will be subject to predation (Wise and Buchanan 2006). Increased lighting could also result in the reduced ability of Central California tiger salamanders and California red-legged frogs to detect and capture prey (Buchanan 1993) or result in antipredator responses associated with a perceived risk of predation due to increased lighting (Lima and Dill 1990) which could in turn affect an individuals' ability to acquire needed resources. Increased nighttime lighting has also been found to affect the timing of migration or dispersal movements of salamanders and frogs (Wise and Buchanan 2006). Effects of lighting will likely be greatest in habitat adjacent to the tournament sports facility and where development abuts the riparian corridor.

Development within the EDC Area will increase the area of impervious surfaces in the Reuse Area which will affect the hydrology and water quality of Mt. Diablo Creek. Increased runoff could result in increased sediment loads, increased turbidity, and increased loads of pollutants, pesticides, and other contaminants (Paul and Meyer 2001). Increased sedimentation, turbidity and pollutants in Mt. Diablo Creek could adversely affect the health and fecundity of California red-legged frogs inhabiting the creek and could potentially reduce their ability to forage if turbidity reaches a level that reduces their ability to detect prey or if contaminant loads result in a reduction of prey populations. It is also likely that the increase in impervious surfaces and urban runoff from development will result in more perennial water within the creek. Although there may be benefits for California red-legged frogs associated with increased availability of aquatic habitat, perennial water may also result in an increase in the number of bullfrogs inhabiting the riparian corridor and result in increased predation of California red-legged frogs.

Indirect effects from increased lighting associated with development will be minimized by implementing restrictions on lighting that will limit the amount, location, and intensity of lighting (see Conservation Measure 13 in the *Description of the Proposed Action* section above). The City will also conduct outreach efforts (see Conservation Measure 12 in the *Description of the Proposed Action* section

above) and install of signage to inform residents and visitors about the presence of special-status species and to inform residents of the importance of maintaining control of pets and avoiding sensitive areas.

Indirect effects from recreational use will be minimized by implementing the conservation measures and siting guidelines described in Conservation Measure 8 in the *Description of the Proposed Action* section above and managing the EBRPD PBC Area according to a Service-approved Long-term Management Plan. Measures to be implemented include siting park facilities and trails in locations that will minimize impacts to Central California tiger salamander and California red-legged frog, limiting recreational use to low intensity activities such as hiking, horseback riding, and non-motorized bicycling; creating buffers around breeding habitat for Central California tiger salamanders and California red-legged frogs; and locating lighting away from sensitive habitat. Adverse effects will also be minimized by establishing large contiguous blocks as Resource Conservation Zones that will be managed specifically for the benefit of species and where recreational use will not be allowed. Resource Protection Zones within the EBRPD PBC Area will be established around the highest quality habitat for listed species within the EBRPD PBC Area; these include 185 acres around the Hilltop Ponds, 35 acres around Cistern Pond, and 400 acres around Rattlesnake Canyon south of Bailey Road.

In addition, to help offset the effects of development and use of park facilities EBPD will remove 10.3 miles of rail lines in strategic locations within the EBRPD PBC Area and will restore segments of existing roads in sensitive areas within Resource Protection Zones. Rail lines can act as barriers to salamander movement (Bartoszek and Greenwald 2009) and existing rail lines within the EBRPD PBC may limit or prevent Central California tiger salamander movement between breeding sites or between upland habitat and breeding sites. Removal of rail lines in the locations shown on Figure 7 will remove potential barriers to Central California tiger salamander movement that could limit dispersal from and movement to and between breeding ponds. The restoration of road segments within Resource Protection zones will help deter recreational use within these restricted areas as well as increase the amount of upland habitat for Central California tiger salamander and California red-legged frog within these areas.

Habitat Conservation, Enhancement and Management

The combined preservation, restoration/enhancement, and management of habitat for Central California tiger salamander and California red-legged frog on-site and off-site will help ensure that local populations of these species persist and continue to have habitat linkages to other habitat in the region. The large block of habitat that will be preserved, enhanced and managed within the EBRPD PBC Area is anticipated to continue to support populations of Central California tiger salamander and California red-legged frog within the Reuse Area. Off-site compensatory lands that will be preserved will aim to complement the ECCC HCP/NCCP preserve system and result in large contiguous blocks of preserved land that will support the formation of habitat linkages described in the ECCC HCP/NCCP and will contribute to regional recovery efforts for these species.

Alameda Whipsnake

Because the area where Alameda whipsnakes are expected to occur within the Reuse Area is limited to the portion of the Reuse Area south of Bailey Road where no EDC-related development will take place, adverse effects to Alameda whipsnake will be limited to those associated with recreational use and development and with habitat enhancement and management within the EBRPD PBC Area.

These activities could result in the injury or death of individual Alameda whipsnakes and/or result in non-lethal harm and harassment of surviving individuals.

Habitat Loss and Fragmentation

The 887 acres of the EBRPD PBC Area south of Bailey Road provide potential habitat for Alameda whipsnake. A small portion (less than 5 acres) of the 16.5 acres of habitat that will be developed with recreational facilities by EBRPD fall within this area. To minimize the loss of Alameda whipsnake habitat, no recreational development will take place within the Rattlesnake Canyon Resource Protection Zone, which is the portion of the Reuse Area most likely to support Alameda whipsnake. The loss of this limited amount of habitat outside of the Rattelsnake Canyon Resource Protection Zone is not likely to result in a decline in the number of Alameda whipsnakes within the Reuse Area or adjacent areas or result in fragmentation of habitat for Alameda whipsnake.

Temporary Habitat Disturbance

Up to 10 acres of habitat for Alameda whipsnake may be temporarily disturbed by habitat restoration, enhancement and creation activities, and by habitat maintenance and management activities. Temporary disturbance or loss of habitat could cause individual Alameda whipsnakes in or near work areas to vacate the area. Displaced whipsnakes will be subject to increased potential for predation and their ability to find required resources such as food and shelter will be reduced as they move.

Mortality, Injury, Harm and Harassment

The use of large and small construction equipment could disturb, collapse, or crush animal burrows resulting in injury or mortality to any Alameda whipsnakes present. Construction traffic in work areas and between work areas may also result in injury and mortality of individuals due to vehicle strike. Vibration, dust, noise, contaminants (i.e. fuel leaks), and lighting associated with use of construction equipment could cause individuals in and near construction activities to vacate the area. Displaced Alameda whipsnakes could be subject to increased potential for predation and their ability to find required resources such as food and shelter may be reduced as they move. Avoidance and minimization measures (see Conservation Measure 4c.*v* in the *Description of the Proposed Action* section above) will be implemented to minimize effects to listed species associated with recreational development and operations and maintenance activities within the EBPRD PBC Area.

Indirect Effects

Recreational use of the EBRPD PBC Area south of Bailey Road will result in indirect effects to Alameda whipsnake similar to those described above for Central California tiger salamander and California. These include habitat disturbance and disturbance of individual whipsnakes as a result of increased human presence, increased predation by urban-adapted and domestic predators, and increased risk of vehicle strikes. Increased human presence could also facilitate other indirect effects such as the spread of disease and non-native invasive species and increased risk of wildfire.

Due to their diurnal activity pattern, Alameda whipsnakes are likely less vulnerable than Central California tiger salamanders and California red-legged frogs to indirect effects associated with night-time lighting. However, because of their tendency to bask in open areas, including roads, trails, and other developed areas (Miller and Alvarez 2016), they are likely more vulnerable to injury or

mortality from vehicle strikes and to human disturbance related to use of recreational trails. The risk for vehicle strikes of Alameda whipsnake will be highest in the proposed parking areas south of Bailey Road and the associated access road.

Locating the access road and parking areas south of Bailey Road outside the Rattlesnake Canyon Resource Protection Zone, will diminish the risk of injury and mortality to Alameda whipsnakes from vehicle strikes. In addition, by establishing the Rattlesnake Canyon Resource Protection Zone around the highest quality habitat for Alameda whipsnake within the Reuse Area, indirect effects to Alameda whipsnake will be minimized. Indirect effects to Alameda whipsnake will be also reduced by implementing the conservation measures and siting guidelines described in Conservation Measure 8 in the *Description of the Proposed Action* section above and managing the EBRPD PBC Area according to a Service-approved long-term management plan.

Habitat Conservation and Management

Because habitat within the EBRPD PBC Area south of Bailey Road (the portion of the Reuse Area that provides habitat for Alaemda whipsnake) will be preserved, enhanced and managed, this area is anticipated to continue to provide habitat for any local populations of Alameda whipsnake that may use this area. In addition, preservation of off-site compensatory lands which will aim to complement the ECCC HCP/NCCP preserve system will also likely provide benefits to Alameda whipsnake populations in the region.

Cumulative Effects

Cumulative effects include the effects of future State, Tribal, local, or private actions that are reasonably certain to occur in the action area considered in this biological opinion. Future Federal actions that are unrelated to the proposed action are not considered in this section because they require separate consultation pursuant to section 7 of the Act. During this consultation, the Service did not identify any future non-federal actions that are reasonably certain to occur in the action area of the proposed project.

Conclusion

After reviewing the current status of Central California tiger salamander, California red-legged frog, and Alameda whipsnake , the environmental baseline for the action area, the effects of the proposed Transfer and Redevelopment of the Former Concord Naval Weapons Station, and the cumulative effects, it is the Service's biological opinion that the Transfer and Redevelopment of the Former Concord Naval Weapons Station, as proposed, is not likely to jeopardize the continued existence of the Central California tiger salamander, California red-legged frog, or Alameda whipsnake. The Service reached this conclusion because the project-related effects to the species, when added to the environmental baseline and analyzed in consideration of all potential cumulative effects, will not rise to the level of precluding recovery or reducing the likelihood of survival of the species based on the following: (1) proposed development is located within the portion of the Reuse Area that provides the lowest quality habitat for listed species; (2) the implementation of numerous conservation measures to minimize the effects of the proposed project on listed species, (3) the preservation and management in perpetuity of over 3,600 acres (should all proposed development occur) of habitat (on- and off-site) for Central California tiger salamander and California red legged frog; and (4) the proposed enhancement and restoration of habitat within the EBRPD PBC Area to offset the

adverse effects of development and recreation on the EBPRD PBC Area on Central California tiger salamanders, California red-legged frogs, and Alameda whipsnakes.

INCIDENTAL TAKE STATEMENT

Section 9 of the Act and Federal regulation pursuant to section 4(d) of the Act prohibit the take of endangered and threatened species, respectively, without special exemption. Take is defined as to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture or collect, or to attempt to engage in any such conduct. Harass is defined by FWS regulations at 50 CFR 17.3 as an intentional or negligent act or omission which creates the likelihood of injury to wildlife by annoying it to such an extent as to significantly disrupt normal behavior patterns which include, but are not limited to, breeding, feeding, or sheltering. Harm is defined by the same regulations as an act which actually kills or injures wildlife. Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing essential behavior patterns, including breeding, feeding, or sheltering. Incidental take is defined as take that is incidental to, and not the purpose of, the carrying out of an otherwise lawful activity. Under the terms of section 7(b)(4) and section 7(o)(2), taking that is incidental to and not intended as part of the agency action is not considered to be prohibited taking under the Act provided that such taking is in compliance with the terms and conditions of this Incidental Take Statement.

The measures described below are non-discretionary, and must be undertaken by the Navy or the Corps respectively so that they become binding conditions of any grant or permit issued to the applicant, as appropriate, for the exemption in section 7(o)(2) to apply. The Navy and the Corps have a continuing duty to regulate the activity covered by this incidental take statement. If the Navy or the Corps (1) fail to assume and implement the terms and conditions or (2) fail to require the applicant to adhere to the terms and conditions of the incidental take statement through enforceable terms that are added to the permit or grant document, the protective coverage of section 7(o)(2) may lapse. In order to monitor the impact of incidental take, the applicant must report the progress of the action and its impact on the species to the Service as specified in the incidental take statement [50 CFR §402.14(i)(3)].

Amount or Extent of Take

California Red-legged Frog

The Service anticipates that incidental take of the California red-legged frog will be difficult to detect due to its life history and ecology. Specifically, when California red-legged frogs are not in their breeding ponds, they may be difficult to locate due to their cryptic appearance and behavior; they may be located a distance from breeding ponds; and the finding of an injured or dead individual is unlikely because of their relatively small body size. In addition, if a dead or injured California red-legged frog is detected, there is no means of equating one dead or injured frog to a number of dead or injured frogs not observed. Losses of California red-legged frog may also be difficult to quantify due to seasonal fluctuations in their numbers, random environmental events, changes in water regime at their breeding ponds, or additional environmental disturbances.

Therefore, the Service is using acres as a mechanism to quantify anticipated take. We estimate that all California red-legged frogs inhabiting the 2,558-acre area consisting of the EDC Area, City-owned portion of the golf course, off-site road improvements, County PBC, and BART parcel will be subject to incidental take in the form of non-lethal harm and harassment during the estimated 35

years of phased development. In addition, because of the difficulty in detecting injured or dead individual California red-legged frogs (for the reasons described previously), the Service will consider the detection of more than twenty (20) injured or dead California red-legged frogs during 35 years of phased development to have exceeded the amount of take anticipated as a result of project-related development activities. Development activities include: all EDC development phases (including CERCLA activities at IR Site 22 prior to start of development); Mt. Diablo Creek restoration and maintenance; golf course construction, operation and maintenance; wetland creation; and installation of the water tank within the portion of the EDC Area that will later be preserved as part of the on-site conservation lands. By setting this threshold we have set an incidental take limit that is measureable, irrefutable, and indicates that the species is being affected at a level where avoidance and minimization measures and project implementation need to be evaluated and possibly modified. This estimate is based on the following assumptions: (1) it is likely that few if any California red-legged frogs will be detected should they be injured or killed by EDC development phases, golf course operation, or wetland creation; (2) most detectable take of California red-legged frogs will occur during Mt. Diablo Creek restoration and maintenance, in particular during in-stream work involving dewatering and relocation of individuals (adult or juvenile frogs) out of work areas; while most of this take is anticipated to be in the form of harassment resulting from capture and relocation, a small percentage of these individuals may be injured or killed.

Within the 2,516-acre EBRPD PBC Area, the Service anticipates that all California red-legged frogs will be subject to incidental take in the form of non-lethal harm and harassment as a result of adjacent development, park operation and use, and habitat restoration/enhancement and management. Although only approximately 85 acres will be developed with park facilities, indirect effects from park operation and public recreation will result in harm and harassment to California red-legged frogs beyond facility footprints. Management activities and habitat restoration and enhancement within EBRPD PBC Areas restricted from recreational use will also result in non-lethal harm and harassment of individuals. In particular, activities such as pond enhancement/restoration and periodic pond maintenance could result in the non-lethal harm and harassment associated with capture and relocation. In addition, the Service will consider the detection of more than one (1) injured or dead California red-legged frog per year to have exceeded the amount of take anticipated as a result of project-related development, operation, or use of recreational facilities, and the detection of more than an average (based on a four-year moving average) of five (5) injured or dead California red-legged frogs (adults, metamorphs, or tadpoles) per year as a result of habitat restoration/enhancement activities or habitat management activities within the EBRPD PBC Area. By setting this threshold we have set an incidental take limit that is measureable, irrefutable, and indicates that the species is being affected at a level where avoidance and minimization measures and project implementation need to be evaluated and possibly modified. This estimate is based on the following assumptions: (1) it is likely that few if any California red-legged frogs will be detected should they be injured or killed by development or use of recreational facilities; (2) most detectable take of California red-legged frogs will occur during pond restoration/enhancement and pond maintenance work that will take place periodically to create and/or maintain favorable habitat conditions; while most take associated with these activities is anticipated to be in the form of harassment resulting from capture and relocation, a small percentage of these individuals may be injured or killed, particularly young metamorphs or tadpoles that may still be present in ponds at the end of the breeding season when pond work will typically take place. Because these types of activities are unlikely to occur every year but could result in higher numbers of individuals being injured or killed during years when work is conducted, we have used a moving average as a threshold for take.

While the proposed project is expected to result in the death or injury of 20 frogs from development activities over the 35 years of phased development as well as one frog per year from recreational development and use, and an average of five frogs per year from habitat management activities, we do not expect that this level of take will eliminate the local metapopulation of California red-legged frogs. As discussed in the effects section of this biological opinion, we expect the local metapopulation of California red-legged frogs to persist within enhanced and preserved habitat in the On-site Conservation Lands and in the Mt. Diablo Creek Riparian Corridor.

Upon implementation of the Reasonable and Prudent Measures, incidental take associated with the Transfer and Redevelopment of the Former Concord Naval Weapons Station Project in the form of harm, harassment, injury, and death of the California red-legged frog in the amount outlined above will become exempt from the prohibitions described under section 9 of the Act. No other forms of take are exempted under this opinion.

Central California Tiger Salamander

The Service anticipates that incidental take of the Central California tiger salamander will be difficult to detect because when Central California tiger salamanders are not in their breeding ponds, or foraging, migrating, or conducting other surface activity, they inhabit the burrows of ground squirrels or other rodents; the burrows may be located a distance from the breeding ponds; their migrations occur on a limited period during rainy nights in the fall, winter, or spring or when juveniles disperse from ponds in the summer; and the finding of an injured or dead individual is unlikely because of their relatively small body size. In addition, if a dead or injured Central California tiger salamander is detected, there is no means of equating one dead or injured salamander to a number of dead or injured salamanders not observed. Losses of this species also may be difficult to quantify due to seasonal fluctuations in their numbers, random environmental events, changes in water regime at their breeding ponds, or additional environmental disturbances.

Therefore, the Service is using acres as a mechanism to quantify anticipated take. We estimate that all Central California tiger salamanders inhabiting the 2,558-acre area consisting of the EDC Area, City-owned portion of the golf course, off-site road improvements, County PBC, and BART parcel will be subject to incidental take in the form of non-lethal harm and harassment during the estimated 35 years of phased development. In addition, because of the difficulty in detecting injured or dead individual Central California tiger salamanders (for the reasons described previously), the Service will consider the detection of more than ten (10) injured or dead Central California tiger salamanders during 35 years of phased development to have exceeded the amount of take anticipated as a result of project-related development activities. Development activities include: all EDC development phases (including CERCLA activities at IR Site 22 prior to start of development); Mt. Diablo Creek restoration and maintenance; golf course construction, operation and maintenance; wetland creation; and installation of the water tank within the portion of the EDC Area that will later be preserved as part of the on-site conservation lands. By setting this threshold we have set an incidental take limit that is measureable, irrefutable, and indicates that the species is being affected at a level where avoidance and minimization measures and project implementation need to be evaluated and possibly modified. This estimate is based on the following assumptions: (1) it is likely that few if any Central California tiger salamanders will be detected should they be injured or killed by EDC development phases, golf course operation, or wetland creation; (2) most detectable take of Central California tiger salamanders will occur along wildlife exclusion fencelines should individuals migrating or dispersing become stranded along fencelines.

Within the 2,516-acre EBRPD PBC Area, the Service anticipates that all Central California tiger salamanders will be subject to incidental take in the form of non-lethal harm and harassment as a result of adjacent development, park operation and use, and habitat restoration/enhancement and management. Although only approximately 85 acres will be developed with park facilities, indirect effects from park operation and public recreation will result in harm and harassment to Central California tiger salamanders beyond facility footprints. Management activities and habitat restoration and enhancement within EBRPD PBC Areas restricted from recreational use will also result in non-lethal harm and harassment of individuals. In particular, activities such as pond enhancement/restoration and periodic pond maintenance could result in the non-lethal harm and harassment associated with capture and relocation. In addition, the Service will consider the detection of more than one (1) injured or dead Central California tiger salamander per year to have exceeded the amount of take anticipated as a result of project-related development, operation, or use of recreational facilities, and the detection of more than an average (based on a four-year moving average) of five (5) injured or dead Central California tiger salamanders (adults, juveniles, or larvae) per year as a result of habitat restoration/enhancement activities or habitat management activities within the EBRPD PBC Area. By setting this threshold we have set an incidental take limit that is measureable, irrefutable, and indicates that the species is being affected at a level where avoidance and minimization measures and project implementation need to be evaluated and possibly modified. This estimate is based on the following assumptions: (1) it is likely that few if any Central California tiger salamanders will be detected should they be injured or killed by development or use of recreational facilities; (2) most detectable take of Central California tiger salamanders will occur during pond restoration/enhancement and pond maintenance work that will take place periodically to create and/or maintain favorable habitat conditions; while most take associated with these activities is anticipated to be in the form of harassment resulting from capture and relocation, a small percentage of these individuals may be injured or killed, particularly juveniles and larvae that may still be present in ponds at the end of the breeding season when pond work will typically take place. Because these types of activities are unlikely to occur every year but could result in higher numbers of individuals being injured or killed during years when work is conducted, we have used a moving average as a threshold for take.

While the proposed project is expected to result in the death or injury of 10 Central California tiger salamanders from development activities over the 35 years of phased development as well as one salamander per year from recreational development and use, and an average of five salamanders per year from habitat management activities, we don't expect that this level of take will eliminate the local metapopulation of Central California tiger salamanders. As discussed in the effects section of this biological opinion, we expect the local metapopulation of Central California tiger salamanders to persist within the enhanced and preserved habitat in the on-site conservation lands.

Upon implementation of the Reasonable and Prudent Measures, incidental take associated with the Transfer and Redevelopment of the Former Concord Naval Weapons Station Project in the form of harm, harassment, injury, and death of the Central California tiger salamander in the amount outlined above will become exempt from the prohibitions described under section 9 of the Act. No other forms of take are exempted under this opinion.

Alameda Whipsnake

The Service expects that incidental take of the Alameda whipsnake will be difficult to detect because this animal may range over a large territory and the finding of an injured or dead individual is

unlikely because of their relatively small body size. Therefore, the Service is using acres as a mechanism to quantify anticipated take. The Service anticipates that all Alameda whipsnakes inhabiting the 887 acres of the EBRPD PBC Area south of Bailey Road will be subject to incidental take in the form of non-lethal harm, harassment, and capture during park operation and management. In addition, the Service anticipates that no more than one (1) Alameda whipsnake will be subject to incidental take in the form of death or injury as a result of development, operation, or use of recreational facilities or as a result habitat management or restoration/enhancement activities and will and be detected.

Upon implementation of the Reasonable and Prudent Measures, incidental take associated with the Transfer and Redevelopment of the Former Concord Naval Weapons Station Project in the form of harm, harassment, injury, and death of the Alameda whipsnake in the amount outlined above will become exempt from the prohibitions described under section 9 of the Act. No other forms of take are exempted under this opinion.

Effect of the Take

In the accompanying biological opinion, the Service determined that this level of anticipated take is not likely to result in jeopardy to the species or destruction or adverse modification of critical habitat.

Reasonable and Prudent Measures

All necessary and appropriate measures to avoid or minimize effects on the Central California tiger salamander, California red-legged frog, and Alameda whipsnake resulting from implementation of this project have been incorporated into the project's proposed conservation measures. Therefore, the Service believes the following reasonable and prudent measure is necessary and appropriate to minimize incidental take of these species:

1. All conservation measures in the *Description of the Proposed Action* section of this biological opinion shall be fully implemented and adhered to. Further, this reasonable and prudent measure shall be supplemented by the terms and conditions below.

Terms and Conditions

In order to be exempt from the prohibitions of section 9 of the Act, the Navy and the Corps must ensure compliance with the following terms and conditions, which implement the reasonable and prudent measure described above. These terms and conditions are nondiscretionary.

1. The Navy, City, and EBRPD shall reduce take of Central California tiger salamander, California red-legged frog and Alameda whipsnake resulting from the Transfer and Redevelopment of the Former Concord Naval Weapons Station Project by implementing the proposed project and conservation measures, as described in the *Description of the Proposed Action* section of this biological opinion.

2. The Navy will ensure that the City complies with the conditions of transfer described in conservation measure 1 in the *Description of the Proposed Action*. The Navy will provide documentation of each parcel transfer described in the *Description of the Proposed Action* of this biological opinion to the Service within five business days of parcel transfer.

3. The Corps shall include implementation and adherence by the applicant to the conservation measures included in the *Description of the Proposed Action* in this biological opinion as a condition of any permit issued for the project.

4. If requested, the Navy, Corps, City or EBRPD (as applicable) shall ensure the Service or their authorized agents can examine the action area for compliance with the conservation measures and terms and conditions of this biological opinion before, during, or after project completion.

Monitoring:

In order to monitor whether the amount or extent of incidental take anticipated from implementation of the project is approached or exceeded, the Navy and the Corps shall ensure the following reporting requirements are adhered to. Should the anticipated amount or extent of incidental take be exceeded, the Navy and the Corps must immediately reinitiate formal consultation as per 50 CFR 402.16.

a. For those components of the action that will result in habitat degradation, modification, or loss whereby incidental take in the form of harm and/or harassment is anticipated, the Service's Sacramento Fish and Wildlife Office (SFWO), Coast Bay Division Chief will be notified as described in Conservation Measure 11 in the *Description of the Proposed Action* Section of this Biological Opinion. Updates shall also include any information about changes in project implementation that result in habitat disturbance not described in the *Description of the Proposed Action* and not analyzed in this Biological Opinion.

b. For those components of the action that may result in direct encounters with listed species, should incidental take in the form of harassment, harm, injury, or death occur, the relevant party (Navy, Corps, City, or EBRPD) will contact SFWO, Coast Bay Division Chief at (916) 414-6623 as described in Conservation Measure 9r in the *Description of the Proposed Action Section* of this Biological Opinion. In addition, in order to ensure that the amount of take described in the *Incidental Take Statement* above is not exceeded, any incidental take of listed species in the form of death or injury will be reported to the City LRA and the City LRA will track the take of individuals resulting from implementation of the Area Plan. Within five days of any injury or mortality of a listed species, the City LRA will provide a report to the Service summarizing the cumulative take of individuals to date.

c. The Navy, Corps, City and EBRPD, respectively, will report sightings of listed or sensitive animal species to CDFW's CNDDB. A copy of the reporting form and a topographic map clearly marked with the location the animals were observed should also be provided to the Service.

Salvage and Disposition of Individuals:

Injured listed species must be cared for by a licensed veterinarian or other qualified person(s), such as the Service-approved biologist. Dead individuals must be sealed in a resealable plastic bag containing a paper with the date and time when the animal was found, the location where it was found, and the name of the person who found it, and the bag containing the specimen frozen in a freezer located in a secure site, until instruction s are received from the Service regarding the

disposition of the dead specimen. The Service contact person is the Coast Bay Division Chief of the Endangered Species Program at the Sacramento Fish and Wildlife Office at (916) 414-6623.

CONSERVATION RECOMMENDATIONS

Section 7(a)(1) of the Act directs Federal agencies to utilize their authorities to further the purposes of the Act by carrying out conservation programs for the benefit of endangered and threatened species. Conservation recommendations are discretionary agency activities to minimize or avoid adverse effects of a proposed action on listed species or critical habitat, to help implement recovery plans, or to develop information. The Service recommends the following actions:

1. The Navy should work with EBRPD during interim management periods and parcel transfer to identify and implement actions that would improve habitat conditions for listed species in the EBRPD PBC Area.

2. The Navy and the Corps should assist the Service in implementing recovery actions identified in the Recovery Plan for the California Red-legged Frog (Service 2002), Draft Recovery Plan for Chaparral and Scrub Community Species East of San Francisco Bay, California (Service 2003), and Draft Recovery Plan for Central California Tiger Salamander (Service 2016).

3. The Navy and Corps should encourage or require the use of appropriate locally collected California native species in revegetation and habitat enhancement efforts.

4. To avoid transferring disease or pathogens while handling amphibians, the Navy and the Corps should follow or encourage applicants to follow the Declining Amphibian Populations Task Force Fieldwork Code of Practice (Service 2005).

In order for the Service to be kept informed of actions minimizing or avoiding adverse effects or benefiting listed species or their habitats, the Service requests notification of the implementation of any conservation recommendations.

REINITIATION—CLOSING STATEMENT

This concludes formal consultation on the Transfer and Redevelopment of the Former Concord Naval Weapons Station Project. As provided in 50 CFR §402.16, reinitiation of formal consultation is required and shall be requested by the Federal agency or by the Service where discretionary Federal agency involvement or control over the action has been retained or is authorized by law and:

(a) If the amount or extent of taking specified in the incidental take statement is exceeded;
(b) If new information reveals effects of the action that may affect listed species or critical habitat in a manner or to an extent not previously considered;
(c) If the identified action is subsequently modified in a manner that causes an effect to the listed species or critical habitat that was not considered in the biological opinion; or
(d) If a new species is listed or critical habitat designated that may be affected by the identified action.

If you have any questions regarding this biological opinion, please contact Ryan Olah, Coast Bay Division Chief (Ryan_Olah@fws.gov), at the letterhead address or at (916) 414-6623 .

Sincerely,

Jennifer M. Norris
Field Supervisor

FINAL - March 2017

SECTION 106 MEMORANDUM OF AGREEMENT BETWEEN THE UNITED STATES NAVY, THE CALIFORNIA STATE HISTORIC PRESERVATION OFFICER, THE CITY OF CONCORD, AND THE EAST BAY REGIONAL PARK DISTRICT REGARDING THE DISPOSAL AND REUSE OF THE FORMER NAVAL WEAPONS STATION, CONCORD, IN CONCORD, CALIFORNIA

WHEREAS, the U.S. Department of Navy (Navy) has closed and is directed under the Defense Base Realignment and Closure Act (DBCRA) of 1990, Pub. L. No. 101-510, as amended in 2005, to dispose of the former Naval Weapons Station, Concord (the "former NWS Concord") in Concord, California; and

WHEREAS, the Navy has previously executed Federal-to-Federal property transfers and approximately 5,038 acres of surplus property at the Inland Area remain available for transfer out of Federal ownership; and

WHEREAS, the Navy is required to protect and maintain surplus property under its caretaker maintenance program prior to transfer; and

WHEREAS, the Navy is authorized to allow for interim use of property under its pre-conveyance licensing and leasing program; and

WHEREAS, the Navy's transfer of approximately 5,038 acres out of Federal ownership and the Navy's caretaker maintenance and pre-conveyance licensing and leasing programs constitute the Navy's Section 106 Undertaking ("Undertaking") and the 5,038-acre area constitutes the Area of Potential Effects (APE); and

WHEREAS, a portion of the APE will be transferred to the City of Concord ("City") and the City proposes economic development (housing, commercial, parks and recreation, roadways/transportation, and other urban infrastructure), creek restoration, and wetland creation on the "City Parcel"; and

WHEREAS, a portion of the APE will be transferred to the East Bay Regional Park District (EBRPD) and the EBRPD proposes to create a regional park that includes conservation, passive recreational and educational facilities, visitor-serving amenities, and a visitor's center on the "EBRPD Parcel"; and

WHEREAS, the Navy consulted with the California State Historic Preservation Officer (SHPO) and other consulting parties on a basewide Historic Evaluation Report which identified no architectural or built historic properties eligible for the National Register of Historic Places (NRHP) and subject to the Navy's property transfer, and received the California SHPO's concurrence on February 14, 2013; and

WHEREAS, the Contra Costa Canal, which includes the Contra Costa Canal, Clayton Canal, and associated facilities including appurtenances, laterals, turnouts, and access roads (collectively, the "Canal"), is a NRHP-eligible resource located within the APE, but is owned by the United States Bureau of Reclamation (USBR) and is not subject to Navy's Undertaking; and

WHEREAS, in the event that USBR would need to issue a permit or use authorization to support alterations to the Canal, the USBR would comply with Section 106, as appropriate; and

WHEREAS, the Navy completed a Phase I archaeological survey of the Inland Area in 2008; and

WHEREAS, the Navy consulted with Federally-Recognized Tribes on a Native American Graves Protection and Repatriation Act (NAGPRA) Plan of Action (PoA) to support the Phase II archaeological evaluation of the Inland Area; and

WHEREAS, in July 2012 the Navy executed a NAGPRA PoA with the California Valley Miwok Tribe, the Ione Band of Miwok Indians, and the Shingle Springs Band of Miwok Indians, which PoA was amended in August 2012, and the Navy reburied all human remains and NAGPRA cultural items on site at archaeological site CA-CCO-680; and

WHEREAS, the Navy identified prehistoric archaeological sites CA-CCO-680 and P-861 as the only NRHP-eligible resources, and determined that there are no identified rural historic landscapes, Traditional Cultural Properties, or Traditional Cultural Landscapes located within the APE that meet the criteria for listing in the NRHP; and

WHEREAS, the Navy consulted on the *National Register of Historic Places Evaluation of 21 Archaeological Sites in Support of the Environmental Impact Statement for Disposal and Reuse of the Former Naval Weapons Station, Seal Beach, Detachment Concord, Contra Costa, California* (Phase II archaeological evaluation report) with all interested consulting parties and received the California SHPO's concurrence on January 23, 2014 that CA-CCO-680 and P-861 are the only NRHP-eligible historic properties within the APE; and

WHEREAS, Site CA-CCO-680 is a prehistoric archaeological site eligible for listing in the NRHP under Criterion D, and the site contains human remains and is culturally and religiously significant to Native American people; and

WHEREAS, Site P-861 is a prehistoric archaeological site eligible for listing in the NRHP under Criteria A and D, and may have cultural and religious significance to Native American people; and

WHEREAS, the Navy consulted with the California SHPO, Advisory Council on Historic Preservation (ACHP), California Valley Miwok Tribe, the Ione Band of Miwok

Indians, the Shingle Springs Band of Miwok Indians, Wilton Rancheria, City, EBRPD, United States Bureau of Indian Affairs (USBIA), United States Army Corps of Engineers (USACE), the USBR, and the Concord Historical Society concerning the Undertaking and historical and archaeological evaluations; and

WHEREAS, the City adopted the Concord Reuse Project Area Plan on January 24, 2012 ("Area Plan," hereafter) and the Area Plan identifies "Development Districts" specifying allowable land uses in each area within the entire APE; and

WHEREAS, Site CA-CCO-680 is located on the City Parcel in the "Greenways, Citywide Parks, and Tournament Facilities" Development District, and Site P-861 is located on the EBRPD Parcel in the "Conservation Open Space" Development District, as depicted in Appendix A; and

WHEREAS, the Navy considered the reasonably foreseeable effects of reuse under the City's Area Plan and notified consulting parties and the ACHP of the Navy's Section 106 finding of adverse effect on March 3 and 4, 2014, respectfully; and

WHEREAS, the ACHP declined to participate in the consultation on April 28, 2014; and

WHEREAS, the property within the APE will not all be transferred simultaneously and instead, the Navy's Undertaking will include phased property transfers anticipated to occur between 2017 and 2026; and

WHEREAS, the City certified the "Concord Community Reuse Project Final Environmental Impact Report (2010)" and "Final Environmental Impact Report (EIR) Addendum (2012)" for the Area Plan in accordance with the California Environmental Quality Act (CEQA) and adopted the "Mitigation Monitoring and Reporting Program for the Concord Community Reuse Project" (MMRP) in accordance with Section 21081.6(a)(1) of the California Public Resources Code and Sections 15091(d) and 15097 of the State CEQA Guidelines; and

WHEREAS, the Concord Community Reuse Project EIR identified sites CA-CCO-680 and P-861 as archaeological resources and imposed mitigation with reference to each of those sites; and

WHEREAS, the City is legally required under Section 21081.6(b) of the California Public Resources Code to monitor and enforce all measures protecting and preserving Site CA-CCO-680 in place, including, Mitigation Measure Cultural Resources 1 that requires the preservation in place of Site CA-CCO-680 prior to the initiation of any earth-disturbing activities within 200 feet of the boundaries of Site CA-CCO-680, and Mitigation Measure Cultural Resources 3 that requires the implementation of inadvertent discovery measures by any public or private entity that engages in earth-disturbing activities; and

WHEREAS, the EBRPD will be conducting park land use planning and will conduct its own CEQA review to develop the EBRPD Parcel into a regional park; and

WHEREAS, the Navy has invited the City and EBRPD to be Invited Signatories to this Memorandum of Agreement (Agreement) in accordance with Title 36 of the Code of Federal Regulations (CFR), section 800.6(c)(2); and

WHEREAS, to facilitate implementation of the Area Plan, the City has applied to the USACE for a permit authorizing it to fill approximately 7 acres of waters of the United States within the APE pursuant to Section 404 of the Clean Water Act of 1977 (33 U.S.C. § 1344) (CWA); and

WHEREAS, the Navy formally accepted the USACE as a consulting party in the Navy's ongoing Section 106 consultation on April 1, 2013; and

WHEREAS, by correspondence to the Navy dated December 14, 2015, the USACE withdrew from consultation on this Agreement and stated that it would accept the Section 106 compliance work undertaken by the Navy and would incorporate the terms of this Agreement into the special conditions of any CWA permit issued; and

NOW, THEREFORE, the Signatory Parties (the Navy and California SHPO) and the Invited Signatories (City and EBRPD) (collectively, the "Signatory Parties" hereafter) agree that the Undertaking as described above shall be implemented in accordance with the following stipulations to take into account the effect of this Undertaking on historic properties.

STIPULATIONS

I. THE NAVY SHALL ENSURE THAT

A. Navy's Interim Management of Historic Properties Prior to Property Transfer

1. Prior to property transfer, the Navy will conduct interim management of Sites CA-CCO-680 and P-861 in the context of its caretaker maintenance and pre-conveyance licensing and leasing programs. These programs include vegetation management, building and infrastructure management actions, and issuance of interim real estate licenses and leases in advance of property transfer.

2. Caretaker maintenance and licensing/leasing actions will be reviewed by Qualified Staff in compliance with this Agreement and 36 CFR § 800. Consistent with the preservation mandates outlined in this Agreement, the Navy will engage in prescriptive avoidance of adverse effects to CA-CCO-680 and P-861.

3. For interim management activities involving ground disturbing activities, Qualified Staff shall determine and document the APE. Consistent with 36 CFR § 800.16(d), the APE will be defined as the geographical area or areas within which interim management activities may directly or indirectly cause alterations in the character or use of historic properties. APEs will include the planned area of surface and subsurface disturbance, including any associated lay down or staging areas. If any part of CA-CCO-680 or P-861 falls within an APE, the entire documented site will be included in the APE to include a buffer of 50 ft. Determination of an APE will not require individual consultation with the SHPO or other Consulting Parties to this Agreement.

4. When Qualified Staff determine that interim management activities with the potential to affect historic properties will not affect listed, contributing or eligible properties consistent with a finding of "No Historic Properties Affected" under 36 CFR § 800.4(d)(1), no further consultation with SHPO or Consulting Parties to this Agreement is required and the action may proceed.

5. For interim management activities, Navy will consult with the Consulting Parties to this Agreement regarding findings of "No Adverse Effect" in accordance with 36 CFR § 800.5(b) and to resolve any adverse effects in accordance with 36 CFR § 800.6.

B. Scope and Limitation of Navy Obligations and Federal Jurisdiction

1. The Navy's Section 106 and Section 110 responsibility and oversight for an NRHP-eligible property (historic property) will continue until the historic property is conveyed to the City or EBRPD, and the Navy's responsibilities will end at transfer of that historic property. Similarly, Federal jurisdiction for inadvertent discoveries also ends at land transfer. Management protocols and commitments by the City and EBRPD that apply to transferred property are described in Stipulations II and III.

2. Since property will be transferred in phases over a period of several years, the Navy, the City, and the EBRPD may each own portions of the former NWS Concord prior to the completion of the Navy's Undertaking. Therefore, the property ownership of any given area shall dictate the legal requirements and responsible party for cultural resources management therein.

C. Deed Notices

1. The Navy shall ensure that the following deed notice appears in any deed conveying property containing Site CA-CCO-680:

> "The GRANTEE, its successors, assigns, and sub-lessees, are hereby notified that the Property contains a National Register of Historic Places-eligible archaeological site determined to be eligible through Section 106 of the National Historic Preservation Act (NHPA) consultation and by consensus with the California State Historic Preservation Officer on January 23, 2014. Site CA-CCO-680 is a prehistoric archaeological site containing human remains, and is approximately 6.75 acres in size. The site is subject to the *Section 106 Memorandum of Agreement Between the United States Navy, the California State Historic Preservation Officer, the City of Concord, and East Bay Regional Park District Regarding the Disposal and Reuse of the Former Naval Weapons Station, Concord, in Concord, California*" (2017). The Memorandum of Agreement terminates ten years after its execution unless extended."

2. Pursuant to a Public Benefit Conveyance for park and recreational uses, the Navy intends to assign property to the Department of Interior (DOI), National Park Service (NPS), which will then issue a deed to the EBRPD. The Navy shall require in its assignment to the DOI, NPS that the quitclaim deed for Site P-861 include the following notice:

> "The GRANTEE, its successors, assigns, and sub-lessees, are hereby notified that the Property contains a National Register of Historic Places-eligible archaeological site determined to be eligible through Section 106 of the National Historic Preservation Act (NHPA) consultation and by consensus with the California State Historic Preservation Officer on January 23, 2014. Site P-861 is a prehistoric archaeological site and is approximately 0.51 acres in size. The site is subject to the *Section 106 Memorandum of Agreement Between the United States Navy, the California State Historic Preservation Officer, the City of Concord, and East Bay Regional Park District Regarding the Disposal and Reuse of the Former Naval Weapons Station, Concord, in Concord, California*" (2017). The Memorandum of Agreement terminates ten years after its execution unless extended."

II. THE CITY OF CONCORD AGREES THAT

A. Site CA-CCO-680 is eligible for listing in the NRHP under Criterion D and contains human remains.

B. Site CA-CCO-680 is culturally and religiously significant to Native American people.

C. The City of Concord will protect and preserve Site CA-CCO-680 by capping it, as described in Stipulation II.D., and preserving it in place within a greenway. The greenway will generally extend along the western boundary of the City Parcel north/northwest of Willow Pass Road. The greenway will accommodate pedestrian use only, and will not provide any active recreational facilities (e.g., no single-use or multi-use trails, no benches, no ball fields, no tennis courts, no basketball courts or hoops, etc.) or designated parking areas on the surface above Site CA-CCO-680. To prevent attracting attention, the site will not be fenced, and no surface treatment (e.g., marker, plaque, mound, boulder, etc.) identifying the site will be installed. The surface of the site will be landscaped with grasses, drought-tolerant plants, or similar landscaping consistent with the adjacent greenway.

D. Because of the reinterment in 1996 and 2012 of human skeletal remains and NAGPRA cultural items within the boundaries of Site CA-CCO-680, this resource shall be preserved in place according to the *Historic Property Treatment Plan For National Register Eligible Archaeological Site CA-CCO-680 (P-07-00003)* (N. Sikes, Ph.D., RPA (December 2015)) (Treatment Plan) attached as Appendix B. The Treatment Plan for CA-CCO-680 describes capping with geofabric atop at least a 4-foot layer of sterile soil over the approximately 2.68-acre portion of the site that retains a concentration of cultural material, intact cultural deposit and reburials; allowable passive pedestrian future uses atop the entire approximately 6.75-acre extent of Site CA-CCO-680, and the preservation of the entire site and an adjoining 50-foot wide protection buffer within a greenway on the land transferred by the Navy to the City.

E. The City will withhold from public disclosure, to the extent permitted by law, information about the location, character, and ownership of Site CA-CCO-680.

F. As a condition of any permit or entitlement issued by the City that will result in ground disturbance within the City Property, the City shall require implementation of Mitigation Measure Cultural Resources 3 contained in the MMRP and the Area Plan EIR, which requires the

implementation of inadvertent discovery measures by any public or private entity during earth-disturbing activities. The required inadvertent discovery measures include a worker education course for all construction personnel, on-site monitoring by Qualified Staff of all earth-disturbing activities within and adjacent to the boundaries of any NRHP-eligible or NRHP-listed property, on-site monitoring by Qualified Staff of all earth-disturbing activities within potentially sensitive native soils/sediments, and procedures for the discovery of cultural resources, including human remains, if Qualified Staff are not present.

G. Should the City's future reuse plans propose modifications or alterations to the Canal, the City of Concord will contact the USBR.

III. THE EAST BAY REGIONAL PARK DISTRICT (EBRPD) AGREES THAT

A. Site P-861 is eligible for listing in the NRHP under Criteria A and D, and may have cultural and religious significance to Native American people.

B. EBRPD will withhold from public disclosure, to the extent permitted by law, information about the location, character, and ownership of Site P-861.

C. EBRPD will protect and preserve Site P-861 as well as an adjoining 50-foot wide protection buffer, within a habitat conservation area that will be restricted from public access.

D. EBRPD will not permit recreational facilities, trails, utilities, parking areas, signage or plaques to be constructed atop Site P-861 or within the adjoining 50-foot wide buffer.

E. Ground disturbance on Site P-861 and within the 50-foot protection buffer surrounding Site P-861 will only be permitted for activities associated with habitat enhancement. If habitat enhancement activities are performed within this buffer area, EBRPD will protect the site from human activities and human agents of EBRPD, to the extent feasible, associated with the habitat enhancement.

F. For any Navy property transferred to EBRPD, the EBRPD will ensure that whenever any ground disturbance activities are undertaken within the EBRPD Parcel, the EBRPD will implement inadvertent discovery measures. The inadvertent discovery measures will include a worker education course for all construction personnel, on-site monitoring by Qualified Staff of all earth-disturbing activities within and adjacent to the boundaries of any NRHP-eligible or NRHP-listed property, on-site monitoring by Qualified Staff of all earth-disturbing activities within

potentially sensitive native soils/sediments, and procedures for the discovery of cultural resources, including human remains, if Qualified Staff are not present.

G. Should the EBRPD's future reuse plans propose modifications or alterations to the Canal, the EBRPD will contact the USBR.

IV. ADMINISTRATIVE PROVISIONS

A. Prior to property transfer, the Navy shall ensure the following:

1. Professional Standards and Qualifications

For the purposes of this Agreement "Qualified Staff" is defined as an individual who meets the Secretary of the Interior's *Professional Qualifications Standards* at 48 Fed. Reg. 44738-44739 (Sept. 29, 1983). Qualified Staff will have professional qualifications, training, and experience relevant to the technical requirements of a given undertaking.

2. Review of Documentation

If a Signatory Party fails to respond to a Navy submission for review within thirty (30) calendar days or such other time specified in this Agreement or the submission, the Navy may assume no comment from the non-responding party. Navy is not required to consider comments received after the specified time. The Navy shall take into account any comments received within the thirty (30) calendar days or other specified time in reaching a final decision on any documentation.

3. Post Review Discoveries

i) In the event of any post-review discovery of archaeological materials during Navy's ownership, all work in the area of the discovery shall stop immediately, and the Navy Base Realignment and Closure Program Management Office shall be notified. The Navy shall ensure that no unauthorized personnel have access to the site and no further work is done in the area of discovery until the Navy has complied with 36 CFR § 800.13(b).

ii) The Navy shall within forty-eight (48) hours notify and consult with the Signatory Parties for any post review discoveries and with the California Valley Miwok Tribe, the Ione Band of Miwok Indians, the Shingle Springs Band of Miwok Indians, if appropriate.

iii) Human remains and associated funerary objects encountered during Navy ownership shall be treated in accordance

with NAGPRA (25 U.S.C. §§ 3001 et seq). Informational copies of any notifications made under NAGPRA shall be provided to the Signatory Parties, California Valley Miwok Tribe, the Ione Band of Miwok Indians, the Shingle Springs Band of Miwok Indians.

iv) The Navy shall ensure that archaeological artifacts recovered from archaeological investigations or post review discoveries shall be stored in a curatorial repository that meets federal standards stipulated in 36 CFR § 79, *The Curation of Federally Owned and Administered Archaeological Collections*.

4. Dispute Resolution

i) Should any Signatory Party to this Agreement object to the performance by the Navy of any obligation under this Agreement, the Navy shall consult with the objecting Signatory Party to resolve the objection and notify the other Signatory Parties of this objection.

ii) If after initiating such consultation the Navy determines that the objection cannot be resolved through consultation, the Navy shall forward all documentation relevant to the objection to the ACHP, including the proposed response to the objection.

iii) Within thirty (30) calendar days after receipt of all pertinent documentation, the ACHP shall exercise one of the following options:

a) Advise the Navy that the ACHP concurs in the proposed response to the objection, whereupon the Navy shall respond to the objection accordingly; or

b) Provide the Navy with recommendations, which the Navy shall take into account in reaching a final decision regarding its response to the objections; or

c) Respond to the Navy that it will not consider the dispute or provide recommendations, in which case the Navy may proceed with the proposed resolution.

iv) Should the ACHP not exercise one of the above options within thirty (30) calendar days after receipt of all pertinent documentation, the Navy may move forward with its proposed response to the objection and make a final decision on how to respond to the objection.

5. Emergency Actions

i) Emergency actions are those actions deemed necessary by the Navy as an immediate and direct response to an emergency situation, which is a disaster or emergency declared by the President or the Governor of the State, or other immediate threats to life or property. Emergency actions under this Agreement are only those implemented within thirty (30) calendar days from the initiation of the emergency situation.

ii) If the emergency action has the potential to affect historic properties, the Navy shall notify the California SHPO and other Signatory Parties as appropriate prior to undertaking the action, when feasible. As part of the notification, the Navy shall provide a plan to address the emergency. The California SHPO shall have seven (7) calendar days to review and comment on the plan to address the emergency. If the California SHPO does not comment or object to the plan within the review period, the Navy shall implement the proposed plan.

iii) Should immediate threats to life or property necessitate prompt action and the Navy is unable to consult with the SHPO in accord with 5.ii. above prior to carrying out emergency actions, the Navy shall notify the SHPO and other Signatory Parties as appropriate within forty-eight (48) hours after the initiation of the emergency action. This notification shall include a description of the emergency action taken, the effects of the action(s) to historic properties, and, where appropriate, any further proposed measures to avoid, minimize, or mitigate potential adverse effects to historic properties. The California SHPO shall have seven (7) calendar days to review and comment on the proposal where further action is required to address the emergency. If the California SHPO does not object to the plan within the review period, the Navy shall implement the proposed plan.

iv) Where possible, such emergency actions shall be undertaken in a manner that does not foreclose future preservation or restoration of historic properties. Where such emergency actions may affect an historic property, they shall be undertaken in a manner that is consistent with the *Secretary of the Interior's Standards for the Treatment of Historic Properties*. Where possible, such actions shall be done with on-site monitoring by Qualified Staff as defined in Stipulation IV.A.1.

v) If the SHPO and/or any other Signatory Party has reason to believe that a historic property may be adversely affected by an

emergency action, the party shall submit a request to the Navy to review and comment on that action.

6. Annual Reporting and Meetings

i) During Navy ownership, the Navy will submit annual reports to all Signatory Parties and Concurring Parties. The Navy will submit annual reports by January 31st of each year to report on activities of the prior calendar year. Email submission is acceptable. At a minimum, annual reports will:

1. Provide a status update on the Navy's Undertaking (status of property transfer);

2. List historic properties within the APE that are subject to a Navy real estate license or lease, or which have been transferred out of Navy ownership;

3. List and explain any problems or unexpected issues encountered in the prior year and Navy's approach to resolution; and

4. Include the Navy's recommendation on whether an annual meeting of Signatory Parties is necessary.

ii) During Navy ownership, the Signatory Parties will convene for an annual meeting or teleconference by March 31st, if requested by the California SHPO.

B. Amendment & Termination

1. Amendment

Any Signatory Party to this Agreement may propose that this Agreement be amended, whereupon all Signatory Parties shall consult for no more than thirty (30) days to consider such an amendment. The amendment will be effective on the date a copy signed by all of the original Signatory Parties is filed with the ACHP. If the Signatory Parties cannot agree to appropriate terms to amend the Agreement, any Signatory Party may terminate the Agreement in accordance with Stipulation IV.B.2., below.

2. Termination

i) If this Agreement is not amended as provided for in Section B.1. of this Stipulation, or if any Signatory Party proposed termination of this Agreement for other reasons, the Signatory Party proposing termination shall, in writing, notify the other Signatory Parties, explain the reasons for proposing termination, and consult with the other Signatory Parties for at least thirty (30) days to seek alternatives to termination.

ii) Should such consultation result in an agreement on an alternative to termination, the Signatory Parties shall proceed in accordance with the terms of that agreement.

iii) Should such consultation fail, the Signatory Party proposing termination may terminate this Agreement by promptly notifying the other Signatory Parties in writing. Termination hereunder shall render this Agreement without further force or effect.

iv) If this Agreement is terminated hereunder, and if the Navy determines that the Undertaking will nonetheless proceed, then the Navy shall comply with the requirements of 36 CFR §800.3-800.6, or request the comments of the ACHP, pursuant to 36 CFR § 800.7(a).

C. Anti-Deficiency Act

The obligations of the Navy under this Agreement are subject to the availability of appropriated funds, and the stipulations of this Agreement are subject to the provisions of the Anti-Deficiency Act. The Navy shall make reasonable and good faith efforts to secure the necessary funds to implement its obligations under this Agreement. If compliance with the Anti-Deficiency Act alters or impairs the ability of the Navy to implement its obligations under this Agreement, the Navy shall consult in accordance with the amendment and termination procedures found at Stipulation IV.B. above.

D. Duration

1. The duration of this Agreement shall be no more than ten (10) years following the date of execution by the Navy and California SHPO, or upon completion of the Undertaking (whichever comes first). If the terms are not satisfactorily fulfilled at that time, the Navy shall consult with the Signatory Parties and Concurring Parties to extend the Agreement or reconsider its terms. Reconsideration may include continuation of the Agreement as originally executed, amendment of the Agreement, or termination.

2. The Navy's obligations under this Agreement with respect to the property or any portion thereof are limited to those obligations accruing prior to transfer of the property, or portion thereof, out of Navy ownership.

3. The City's obligations under Stipulation II of this Agreement will apply only to those portions of the property that are owned or subject to the control of the City.

4. EBRPD's obligations under Stipulation III of this Agreement will apply only to those portions of the property that are owned or subject to the control of EBRPD.

5. The Undertaking will be complete when the Navy executes the transfer of the last parcel of surplus property at the former NWS Concord. The Navy shall notify all Signatory Parties and Concurring Parties when the Navy has executed the transfer of the last parcel of surplus property.

EXECUTION

Execution of this Agreement by the Navy and California SHPO and the implementation of its terms evidence that the Navy has taken, and will take, into account the effects of the Undertaking on historic properties at the former NWS Concord and afforded the ACHP an opportunity to comment.

APPENDIX C: DEFINITIONS

Agreement. The Memorandum of Agreement memorialized in this document. Where not directly addressed in this Agreement, the rights, obligations, and other duties of the Navy shall be determined by 36 CFR § 800 and applicable Navy regulations and guidance.

Concurring Party. A consulting party concurring in this Agreement in accordance with 36 CFR § 800.6(c)(3). Concurring Parties are the parties who sign this Agreement, other than the Signatories and Invited Signatories.

Consulting Party. A party as defined in 36 CFR § 800.2(c), composed of Signatories, Invited Signatories, and Concurring Parties, and those parties who elect not to concur in this Agreement but participated in the consultation to develop this Agreement.

Invited Signatory Party. A party that is invited by the Navy to sign this Agreement as an Invited Signatory Party shall, upon becoming a Signatory Party, have the same rights with regards to seeking amendments or termination of this Agreement as other Signatory Parties. Invited Signatory Parties are: the City of Concord (City) and East Bay Regional Park District (EBRPD).

Qualified Staff. An individual who meets the Secretary of the Interior's *Professional Qualifications Standards* at 48 Fed. Reg. 44738-44739 (Sept. 29, 1983).

Signatory Party. A party with rights and obligations with respect to this Agreement as defined in 36 CFR § 800.6(c)(1). Signatories are: Department of Navy (Navy) and the California State Historic Preservation Officer (SHPO), and those Invited Signatories signing this Agreement.

Undertaking. The transfer out of Federal ownership of approximately 5,038 acres of the Inland Area of the former Naval Weapons Station (NWS) Concord and the Navy's caretaker maintenance and pre-conveyance licensing and leasing programs.

Appendix K Response to Public Comments

This page intentionally left blank.

Erica Spinelli,
Project Manager
Concord Naval Weapons Station Project

I am a lifelong Concord resident and want to add my comment to the Plans for developing the former Concord Naval
Weapons Station site.

At this time, I recommend that we adopt the "no action alternative" as outlined below.

2-17
2.2.5
No Action Alternative
The No Action Alternative is retention of the former NWS Concord property by the U.S. government in caretaker status. No reuse or redevelopment of the property would occur. Any current approved uses on the property would continue until remaining leases expire or the Navy decides to renew the lease. No new leases would be created under the No Action Alternative. Facilities would be maintained in accordance with the BRAC Program Management Office (PMO) Building Vacating, Facility Layaway, and Caretaker Maintenance Guidance, published in March 2007. In accordance with the
BRAC PMO Building Vacating, Facility Layaway, and Caretaker Maintenance Guidance, only conditions adversely affecting public health, the environment, and safety would be corrected in nonresidential areas. Any remedial activities underway would continue until environmental cleanup is complete."

There is no need for the People of Concord to be in a hurry to develop this site. The current plans proposed will add and additional 20,000 to 30,000 people to our City which will significantly increase traffic congestion both in and around Concord and Central Contra Costa County, tax our water infrastructure during a time of drought, and impact our quality of life here in Concord.

If this area is to be developed in the future, has anyone given any thought to develop this area for agricultural purposes (e.g- farms) or possibly re-locating Buchanan airport to this location which will open land in that part of town for developing?

Respectfully submitted,

Alan Altorfer

Comment noted.

0001-2
As noted in the EIS, the purpose of the proposed action is to dispose of surplus property at the former NWS Concord for subsequent reuse in a manner consistent with the policies adopted by the City of Concord. The need for the proposed action is to provide the local community the opportunity for economic development and job creation.

Alternative 1 (the Preferred Alternative) is reuse of the surplus property consistent with the City of Concord's Area Plan, as adopted. As discussed in Chapter 1, the Area Plan upon which Alternative 1 is based was the result of an extensive reuse planning process that took place between 2008 and 2012 undertaken by the City of Concord, during which seven alternatives were evaluated. All seven of the alternatives were variations on mixed-use development. In accordance with NEPA, the Navy is also evaluating an alternative to the proposed action, Alternative 2 (Intensified Reuse), which is also consistent with the policies developed by the City of Concord during the reuse planning process but represents a higher intensity of use overall. Please see Chapter 2, Proposed Action and Alternatives, for further detail on how the Alternatives were developed.

Contra Costa County **Fire Protection District**

November 25, 2014

Director, NAVFAC BRAC PMO West,
Attn: Ms. Erica Spinelli, NEPA Project Manager
1455 Frazee Road, Suite 900
San Diego, California, 92108-4310

Dear Ms. Spinelli,

Please find our comments regarding the NWS Concord EIS below:

DEIS Alternate One
(pages ES-4, 2-31, et al.)

The Contra Costa County Fire Protection District and the Office of the Sheriff, Contra Costa County strongly supports Alternate One. Both the Fire District and the Sheriff's Office have spent hundreds of hours and approximately $50,000 in pursuit of the Public Safety Training Campus to be located on the CNWS land reuse area north of Highway 4. This training campus will not only benefit all of the residents of Contra Costa County (and the surrounding Bay Area) but will specifically benefit the City of Concord with substantial public safety resources located within the city limits. Additionally, Military Ocean Terminal Concord (located just north of the proposed training campus), will have immediate access to training and emergency resources from the Public Safety Training Campus.

In addition to the labor and resources that the Fire District and the Sheriff's Office invested in Alternate One, the residents of Concord have spent thousands of hours analyzing and reviewing many different land use scenarios to arrive at Alternate One as the best choice for the current and future residents of Concord.

The residents of the City of Concord and numerous regional stakeholders created Alternate One for the reuse of the former Concord Naval Weapons Station. The planning process culminated with the Concord City Council unanimously certifying an addendum to the Final EIR for the Concord Reuse Plan, adopting the Concord Reuse Project Area Plan (CRP Area Plan) and consistency amendments to the Concord 2030 General Plan. These actions set policy and development standards in place that ensure reuse of the base that it be developed in accordance with the recommendations of community and with the unanimous affirmation of the City Council.

Concord Facilities Fees
(Page 3-141)

The DEIS states that Concord has a Development Fee (also known as "Facilities Fees" or "Impact Fees"). Not only is the Fire District unaware of the existence of these fees, the City Clerk was not able to provide the Fire District with any city ordinance stating that these fees are in place. Additionally, the fee amounts that are stated in the DEIS are older fees that were in place until approximately 2008.

The fee structure stated in the DEIS is generally designed for single to small development projects to account for incremental growth within the Fire District. With a development project of this size, the ordinances adopted by the Fire District allow for negotiated terms in order to provide adequate fire and emergency services for new, large scale developments that will have an impact and increased demand on the current capabilities of the Fire District. It is expected that fire and emergency services will be available, and of a capacity necessary for the increased service demand, from the start of occupancy of a development or project and not when sufficient fees are collected to start to build a fire station. The Fire District would expect to have developer-funded resources available early in the occupancy process for this project.

New Fire Stations in the CNWS development area
(Page 4-116)

Several times in the DEIS there is reference to the need for two new fire stations to serve the new development. Also stated is that the old CNWS Fire Station could be used as one of the needed public safety fire stations. This Fire Station is economically and functionally obsolete. Building IA7, the Inland Firehouse was built in 1945. It cannot be cost-effectively made to provide mandated services to the development of the CNWS residential and business areas. Its location north of Highway 4 puts the firefighters and paramedics well out of established coverage area standards for locating fire stations to best serve the public.

While it is stated in the DEIS that two fire stations would be needed in the new development area, this is a minimum. With review of the density and configuration of the development in relation to existing resources, three fire stations and the associated staffing, apparatus, and equipment may be required.

3.10.3.2 Fire and Emergency Medical Services (EMS)
(page 3-142)

The information contained in the report is no longer accurate. The following information should be included as accurate based on current staffing and current EMS arrangement:

Fire protection at the former NWS Concord is primarily provided by the MOTCO Fire Department. A fire protection facility located just north of Highway 4 on the former NWS Concord was originally built to provide services to the Navy and is no longer in operation. It is no longer serviceable as a fire station.

0003-1

0003-2

0003-3

0003-4

0003-1
Reference to the Contra Costa County Fire Protection District (CCCFPD) Development Fees has been deleted from Section 3.10.3.2. New information was added to this section to clarify that the City of Concord does not currently charge fire-related fees for new development projects and to clarify that the number and location of facilities, as well as funding, is typically identified through other detailed planning processes. In addition, the references to the development fee in Sections 4.10.1.2 and 4.10.2.2 were deleted and replaced with the information provided above.

0003-2
Comment noted. The City of Concord's Area Plan anticipates that two fire stations will be needed to serve the site. If rehabilitation of the Inland Firehouse is not feasible, two new stations will be constructed. The location of the future fire stations serving the site, along with funding for the stations, will be determined by the City in conjunction with the Contra Costa County Fire District through one or more later, project-specific, local planning processes. In addition, the Army currently operates an emergency response facility at the Military Ocean Terminal Concord (MOTCO) that is anticipated to be available for mutual aid response as long as MOTCO is in operation. This information was added to and/or revised as appropriate in Sections ES.2, 2.2.3.2, Table 2.4, 3.10.3.2, and 4.10.1.2.

0003-3
Please see responses to Comments 0003-1 and 0003-2 for further detail.

0003-4
Sections 3.10.3.2 and 4.10.1.2 have been updated to reflect information obtained in personal communication with the commenter as of 2017. Figure 3.10-1 was revised to reflect the station closures cited in the comment letter.

A mutual aid agreement, signed in 1998 between the Navy and the CCCFPD, allows the NWS Concord Fire Department and CCCFPD to provide joint protection and emergency services to the region if additional resources are needed by either department.

Fire protection and EMS services in the City of Concord are provided by the CCCFPD. The CCCFPD provides fire services to nine cities, including Antioch, Clayton, Concord, Lafayette, Martinez, Pittsburg, Pleasant Hill, San Pablo, and Walnut Creek as well as several unincorporated areas of Contra Costa County, including the communities of Bay Point, Clyde, El Sobrante, Pacheco, and Port Chicago from 23 fully-staffed stations located throughout the region. The locations of these fire stations as shown in Figure 3.10-1 (CCCFPD 2013) is no longer accurate based on station closures that occurred in 2013. Currently, the 23 stations are staffed with a daily minimum of 71 personnel. During FY2014-2015, the district had a total of 323 authorized personnel (213 fire suppression, 17 chief officers, and the remainder serving in administration, fire prevention, communications, and other support services capacities) serving approximately 600,000 people, with a ratio of approximately one fire station per 26,086 people or .36 firefighting personnel per 1,000 residents. Fire station closures and staffing reductions resulted in the closure of 5 fire stations and 7 fire crews during 2011-2013. It is anticipated that as of February 1, 2015 the total on-duty staffing of the CCCFPD will be increased to 24 engine/truck companies and 2 EMS squads for a total of 78 front-line fire suppression personnel on duty every day. There are no additional increases in staffing planned.

In addition to services provided by CCCFPD personnel, the district also maintains mutual aid agreements with all fire agencies in Contra Costa County, including the East Contra Costa Fire Protection District (ECCFPD), the EBRPD, the California Department of Forestry and Fire Protection (CAL FIRE), and private industrial companies. These agreements provide the CCCFPD with emergency response assistance on an as-needed basis.

The CCCFPD provides first responder EMS services with advanced life support (ALS) paramedics on every fire apparatus. The County contracts with American Medical Response (AMR) CoCo County for paramedic ambulance 911 response and transport services. A new countywide contract for ambulance services is open for bidders and will be awarded in late 2015.

Subject: my comments regarding NWS Concord EIS

Erica,

Thank you for the open house public meeting regarding the Draft NEWS Concord WIS.

I am in favor of the **No Action Alternative**. Already the City of Concord is planning development of thousands of units in Downtown Concord which will add approximately 10,000 people to the area. I'd like to see them complete that project before tackling the development of the Concord Naval Weapons Station area. I bought a house in Concord recently because it's a suburb but with continued development it's becoming an urban center. Those of us who would be negatively impacted would be the residents of Sun Terrace, Holbrook Heights and Dana Estates. North Concord already endures air and noise quality issues because of Highway 242, Highway 4 and Buchanan Airport. We are subjected to safety issues with the constant landing and take-off of planes overhead, as well as the fear of an explosion from the Golden Eagle refinery owned by Tesoro, Inc. It's not uncommon to smell petroleum from time to time as the refinery does "maintenance" work. The Delta breeze brings it right our way.

Please don't add to the problems of the residents of the area by adding dense housing, more cars, more noise, etc. Noise travels far in the Diablo Valley due to the terrain. It does not have many trees, and shrubs to absorb sound. The Concord NWS is more barren and sound would intensify. Your study does not take this into consideration; it only measures from the starting point which already is problematic due to lack of sound absorption. Sure a developer could put in landscape to help absorb sound but we're also in a major drought and need to think long-term.

I don't like the impact it would have on the wildlife. Although both Alternatives 1 and 2 propose up to 70 percent open space, humans would still be accessing the area. If the East Bay Regional Parks District obtains it, I'm sure paths will be created and people will be tromping through the area with their dogs, etc.. I like that it would protect the area from development but it does not necessarily protect the wildlife inhabitants. They too need space to roam.

I would like to see this area remain under caretaker status. I'm a proponent of population stabilization not continued growth. Building more houses, businesses, etc. are not the answer to this area.

Thank you for reading my comments.

Sincerely,
Suzanne Delbou

Re: Draft Environmental Impact Statement for the Disposal and Reuse of the Naval Weapons Station Seal Beach Detachment Concord (NWS Concord), City of Concord, California

Dear Ms. Spinelli:

The City of Antioch would like to submit the attached letter dated October 26, 2009 originally submitted to the City of Concord during the public comment period associated with the Environmental Impact Report prepared by Concord for the Naval Weapons Station Reuse Project. The attached comments focus on transportation impacts and were jointly submitted by the East Contra Costa County Transplan Committee, a joint powers authority coordinating the transportation interests of the communities in eastern Contra Costa County.

Although the City of Concord did provide a response to comments, the City of Antioch continues to have significant concerns regarding impacts of a reuse plan on the regional transportation network. It is requested that the EIS address the concerns contained in the attached letter.

Sincerely,

Mindy Gentry

TRANSPLAN COMMITTEE
EAST COUNTY TRANSPORTATION PLANNING
Antioch • Brentwood • Oakley • Pittsburg • Contra Costa County
651 Pine Street -- North Wing 4TH Floor, Martinez, CA 94553-0095

October 26, 2009

Mr. Michael Wright
CNWS Reuse Project Director
City of Concord
1950 Parkside Drive
MS / 56
Concord, CA 94519

Dear Mr. Wright:

The following are comments from TRANSPLAN and its member jurisdictions on the Draft Environmental Impact Report (DEIR) for the Concord Community Reuse Project. As you may be aware, TRANSPLAN coordinates the transportation interests of the communities in eastern Contra Costa County. All of the cities in East Contra Costa and the County are members of TRANSPLAN and believe that with appropriate mitigation measures and policy revisions, as discussed below, the project will be the "world class project" the City seeks.

In considering the broad environmental concepts described in the DEIR and given the BART station area context, TRANSPLAN and its member jurisdictions support the reuse of the naval weapons station. However, we believe that only by the City of Concord working closely and collaboratively with TRANSPLAN jurisdictions to address the impacts described in the DEIR will a "world class project" be possible. We take this opportunity to thank the City for expanding the environmental review to include facilities in the TRANSPLAN region and disclosing the impacts. We hope this is the first step in a dialog which will serve to improve this exciting project.

The DEIR describes the Reuse Plan as the Local Reuse Authority's vision for redevelopment of the inland portion of the naval weapons station. The City may subsequently undertake further planning actions such as amending its General Plan and zoning ordinance to accommodate the Reuse Plan. TRANSPLAN would like to receive California Environmental Quality Act notices for any subsequent planning actions by the City.

As a result of a recommendation from a joint TRANSPAC/TRANSPLAN Technical Advisory Committee meeting held in May 2008, the Contra Costa Transportation Authority included in its 2009/2010 work plan the *State Route 4 Corridor Management Plan*. Once this planning process gets underway this plan may be an appropriate forum to discuss the impacts of the project and expand upon and further define the mitigation measures in the DEIR as discussed in more detail below.

The comments below are in sequential order as they appear in the DEIR, **not** in order of priority.

Chapter 4: Transportation

1. *Section 4.1.1: Introduction Page 4-1: "The site...is served by a network of...transit services, and bicycle and pedestrian facilities ...".* While acknowledging the language in this section is perfunctory, it underscores the fundamental mischaracterization of transit and to a lesser extent, non-motorized facilities found throughout the document. Transit service in the project vicinity is very limited; rather than a "network" it would better be characterized as "skeletal". This does not speak to the even greater limitations of the bus transit districts in developing **new service** to support the proposed project. TRANSPLAN believes that new, ongoing dedicated funding for bus service must be developed in conjunction with any development on the project site. Without this funding, future bus service to the

0010-1

0010-1
The City of Antioch requested that the EIS address the concerns contained in the attached comment letter from the East Contra Costa County Transportation Planning Committee (TRANSPLAN), which was originally submitted in response to publication of the City of Concord's 2009 Draft Concord Community Reuse Plan EIR (2009 EIR). The 2009 letter was resubmitted by the City of Antioch during the comment period for the Navy's 2014 DEIS. The Navy has reviewed all comments in relation to the EIS. Where a TRANSPLAN comment does not apply specifically to the 2014 DEIS, the Navy is responding to the comment in a more global sense.

This comment requests that the current state of transit funding be referenced in the EIR specifically and that the City of Concord guarantee that the necessary transit service will be present by providing funding to pay for service at the former NWS Concord. The City of Concord addressed this comment in the 2010 Response to Comments on the August 2009 Draft Revised EIR (2010 RTC). The Master Response Transportation 2 in the 2010 RTC stated: "A transit financing plan is not appropriate at this level of analysis; however, as the transit network continues to develop, the issue of transit financing will be discussed with the appropriate transit operators and will be addressed in future environmental documents. The City of Concord will pursue expected new funding opportunities collaboratively with local transit operators."

In addition, subsequent to the certification of the 2010 Final Concord Community Reuse Plan EIR, the City of Concord refined the Reuse Plan in 2012 and adopted the resulting Concord Reuse Project Area Plan (Area Plan) and amended Concord's citywide Concord 2030 General Plan to include the Area Plan. As a result of the Area Plan amendment, the Concord 2030 General Plan Transportation Section includes Policy T-1.2.3: Use impact fees, development agreements, and other funding mechanisms to construct the transportation system and support Transportation Demand Management programs on the Concord Reuse Project site, including transit services and facilities. In the 2010 Mitigation Monitoring and Reporting Program for the Concord Community Reuse Project (MMRP) the City of Concord committed to conducting a Nexus Study, required pursuant to the Mitigation Fee Act, for the entire former NWS Concord site to establish an equitable traffic impact-fee rate for each land use category to ensure that future development projects will contribute a fair share of the unfunded costs of planned improvements and mitigation measures. In the MMRP, the City of Concord also committed to requiring future developers to contribute a traffic

impact fee in accordance with the TRANSPAC Subregional Transportation Mitigation Fee Program requirements of the Central County Action Plan for Routes of Regional Significance.

As referenced in the documents above, transit funding related to the former NWS Concord site is within the City of Concord's jurisdiction. Sections 4.11.2 and 4.11.3 of the FEIS reference the City of Concord's Transportation Demand Management programs that will be supported by various funding mechanisms under the direction of the City of Concord. The EIS also references the City of Concord's Nexus Study and the traffic impact fee in accordance with the TRANSPAC Subregional Transportation Mitigation Fee Program in Section 4.11.2 and Table 7-1.

development should not be assumed, and should not be considered a mitigation strategy but rather an impact, which is the creation of a demand for bus service in face of declining (or completely absent) service. The DEIR references SB375 when describing the transportation demand management (TDM) approaches to project mitigation. Local jurisdictions from a County which has a rich history of multi-jurisdictional collaborative planning should recognize the flaw in the State's approach to addressing climate change and seek to improve upon it. Requiring or planning for transit supportive land use patterns without transit funding (or in the State's case **eliminating** transit funding) is a fundamentally flawed approach. TRANSPLAN calls on the City to be a statewide model for combating climate change and not assume that transit service will be present; but rather guarantee that the necessary transit service will be present by providing the funding to pay for service to be extended to serve the project.

With regards to *"...network of...bicycle and pedestrian facilities...":* The 2009 update to the Contra Costa County Bicycle and Pedestrian Plan shows bicycle facilities surrounding the project area and the vast majority of them are "planned" and Class III. Class IIIs are the lowest class in the Caltrans bicycle facility hierarchy offering the least benefit to the cyclist. This will not facilitate the desire to have good connectivity to existing Concord as expressed in the DEIR. TRANSPLAN is confident that a world-class bicycle network will be developed *within* the boundaries of the project. However, unless a network is developed outside the project boundaries that connect the project to greater Contra Costa, improvements in non-motorized share of mode split will not be realized and the project will not truly fulfill the goal of *"...supporting a broad range of travel choices..."*. Building on our comments in our 7/16/08 letter, prior to any development on the project site the City should commit to:

- Completing planned/proposed bicycle and trail facilities (in the Concord Trails Masterplan, the Contra Costa County Bicycle and Pedestrian Plan or the City of Concord General Plan) either within a two mile radius of the project boundaries or that otherwise serve the project,
- Closing any gaps identified in either the Contra Costa Countywide Bicycle and Pedestrian plan or the Metropolitan Transportation Commission's Regional Bikeway Network (To the extent they aren't already represented by the project's planned facilities).
- Ensuring that the connections to all BART stations in the study area (Concord, North Concord/Martinez, and Pittsburg/Bay Point) are superior and seamless. The City should commit to funding any necessary improvements at these stations necessary to support both additional and improved bicycle access. These connections should be marked on-street lanes at a minimum but, where possible, should include different facility types to accommodate a range of user abilities and comfort levels. The "blank slate" afforded by the reuse of the station area should be taken advantage of through the encouragement of walking and bicycling through the provision of superior facilities.

2. *Section 4.1.2.1: State: Page 4-2:* Implementing TDM strategies as a wholesale replacement for capacity increases as a mitigation is not supported by the City's current Growth Management policies (which includes level of service standards for basic routes and routes of regional significance) which sanction changes to the Capital Improvement Program in order to meet standards (Policy GM-1.3.3 [The City has not demonstrated that improvements are not possible or feasible nor has a request for "special circumstances" been made public]).

   TRANSPLAN believes that relying on SB375 to relieve the City of the responsibility for mitigating congestion related impacts through capacity expansion is problematic:

   a. The state has not yet released guidelines for the implementation of SB375,
   b. TRANSPLANs understanding of SB 375 is that implementation will begin, initially, with regional (Bay Area-wide) agencies. Compliance implications will eventually be seen at the local level but this is not yet the case. If this is not the case please cite specific requirements or policies which compel the City to abandon the local standards of congestion mitigation.

0010-1 cont'd
Please see previous page for response.

0010-1
Continued

0010-2
Originally submitted in response to publication of the 2009 Draft EIR, this comment requests various City of Concord commitments related to the bicycle and trail network developments outside the former NWS Concord to facilitate connectivity. The City of Concord addressed this comment in the 2010 RTC. The Master Response Transportation 1 in the 2010 RTC stated that the location and characteristics of the on-site bicycle and pedestrian network were informed by local and county-wide system plans such as the Concord Trails Master Plan and the Contra Costa Countywide Bicycle Master Plan. The Concord Trails Master Plan and the Contra Costa Countywide Bicycle Master Plan address planned pedestrian and bicycle facilities beyond project boundaries. In addition, the Concord 2030 General Plan Transportation Section includes bicycle and pedestrian principles and policies (i.e., Principle T-1.7: Provide Safe and Convenient Pedestrian Circulation, and Principle T-1.8: Provide a Safe and Comprehensive Bicycle Network). Policy T-1.7.4 states: "Prioritize pedestrian connections from new development to nearby open spaces and trails." Plans for the Concord Reuse Project include connections from the sidewalk system to a network of off-road walkways and regional park trails. Policy T-1.7.1 states: "Develop off-street pedestrian linkages, including approaches such as connections allowing pedestrians to travel through the ends of cul-de -sacs, pedestrian paths, bridges over creeks and roadways, and pedestrian underpasses, to minimize walking distance and enhance pedestrian circulation throughout the City; consider planned development on the Concord Reuse Project site when establishing such linkages." The Concord 2030 General Plan Transportation Section also states that future amendments or updates to the Countywide Plan and the City's Trails Master Plan may be needed to reflect proposals for the Concord Reuse Project site.

0010-2

0010-3

As referenced in the documents above, the bicycle and trail network outside the former NWS Concord site is within the City of Concord and Contra Costa County's jurisdictions. An overview of pedestrian and bicycle facilities as they pertain to the former NWS Concord is included in Section 3.11.6 of the FEIS and identifies the regional bicycle network in Figure 3.11-5, Bike Trails. Figure 3.11-5 has been updated to reflect the off-site bicycle network from the most recent Contra Costa Countywide Bicycle Master Plan GIS data (2010) and the City of Concord's

proposed bikeway network from Concord's Bicycle, Pedestrian & Safe Routes to Transit Plan (2016).

0010-3
Originally submitted in response to publication of the 2009 Draft EIR, this comment refers to the City of Concord's plan to implement Transportation Demand Management (TDM) strategies as a mitigation measure in the 2009 EIR. The City of Concord addressed this comment in the 2010 RTC. In response 19-7 in the 2010 RTC, the City of Concord indicated that they did not rely on SB375 or abandon local policies when developing TDM strategies as mitigation. In addition, the City stated that the requirements of Measure J and the Growth Management Element of the Concord General Plan do not preclude the use of TDM programs to address impacts. The Concord 2030 General Plan Transportation Section has also been amended to include Policy T-1.2.3: Use impact fees, development agreements, and other funding mechanisms to construct the transportation system and support Transportation Demand Management programs on the Concord Reuse Project site, including transit services and facilities.

Sections 4.11.2 and 4.11.3 of the Final EIS reference the City of Concord's TDM programs. Table 7-1 has been revised to incorporate additional detail on TDM strategies and the coordination with affected jurisdictions that will be required as part of the City of Concord's adopted MMRP process addressing physical roadway improvements.

c. What is the legal requirement for the City to change the course of an existing environmental review to comply with recently adopted state legislation? This questionable responsibility (see comment above) taken on by the City burdens affected jurisdictions in that it requires the re-interpretation of document under this new statutory light - the implementation of which, at this point, is speculative.

d. Abandoning long held local policies that "*...ensure new growth provides adequate facilities*...." and "*pay its own way*" (page 4-1 of the City of Concord General Plan) by relying on State legislation which the State itself has yet to agree on how to implement (the Air Resource Board's Regional Technical Advisory Committee is just now finishing it's advisory work on this very topic) is premature at best.

e. Caltrans, in their 7/22/08 comment letter, stated that the forecasted levels of service on state facilities are "*unacceptable*" and requested that coordination regarding mitigation measures take place. In light of SB375, has Caltrans retracted this requirement and provided an opinion regarding the intent of the City to rely on TDM measures to ensure adequate performance on its facilities?

f. Notwithstanding the uncertain policy basis which the City is relying on to use TDM strategies as a mitigation measure, substantially more specificity on the character of the TDM program must be provided, and the effect of the program must be quantified. Without the specificity or quantification they cannot be considered feasible, effective or enforceable as required under the California Environmental Quality Act.

In order for TDM strategies to have a meaningful effect on VMT, congestion or other automobile related impact, an extraordinary effort will have to be made on the part of the City. This level of effort is consistent with the goal of a "world class project" espoused in the DEIR, Comments regarding what these efforts can be found throughout this letter.

3. *Section 4.1.2.3: Local: Page 4-2*: Contrary to the information in this section, the EIR is not consistent with the technical procedures which state:

> *The traffic impact analysis must include, as a minimum, consideration of the following scenarios...Existing conditions plus approved development with mitigations plus the project...*

The *Existing Conditions, 2030 No Project,* and *Preferred Alternative* and *Concentration and Conservation Alternative in the year 2030* are useful and serve specific purposes in the environmental review. Excluding the existing plus project scenario not only departs from the technical procedures and serves to diminish the impacts of the project by isolating the analysis of the project from the current, familiar traffic context but conflicts with the consistent theme throughout the document that a conservative approach to identifying impacts is being used.

4. *Section 4.1.2.3: Local: Page 4-4:* The infill opportunity zone policies cited in the document include the following limitations which may apply to the subject project:

> *A city or county may not designate an infill opportunity zone after December 31, 2009.*
>
> *If no development project is completed within an infill opportunity zone by the time limit imposed by this subdivision* (4 years)*, the infill opportunity zone shall automatically terminate.*

If the City has made the necessary designations please provide documentation establishing this. How will the City comply with the development time limits (4 years) in the policies?

5. *Section 4.1.3.1: Freeways and Ramps: Page 4-4:* Caltrans, MTC and the Contra Costa Transportation Authority are in the process of developing a Corridor Systems Management Plan (CSMP) for State

0010-3
Continued

0010-4
Originally submitted in response to publication of the 2009 Draft EIR, this comment refers to the 2009 EIR and Contra Costa Transportation Authority's (CCTA's) technical procedures related to transportation analyses. Similar to the analysis scenarios studied in the 2009 EIR, the DEIS studied "reasonable" scenarios for the Proposed Action. Three scenarios were analyzed in the DEIS, including year 2040 conditions plus Alternative 1; year 2040 conditions plus Alternative 2; and the No Action Alternative. Per NEPA, the approach to the EIS (and the TIS) applied reasonable methodologies to study the Proposed Action, which is the development program for the entire NWS site that would occur over a 20-year buildout horizon, such that an "existing plus project scenario" was not considered a reasonable future condition for the EIS analysis. Incremental growth of the project will occur over 20 years and, given the long timeline, growth in the population and employment is expected. Therefore, analysis of the Proposed Action includes background traffic. While this approach does not present a "familiar traffic context" of existing conditions from which the impacts of the full project can be isolated, it provides a reasonable scenario to capture the potential effects of the Proposed Action on the transportation system for a programmatic EIS.

0010-4

0010-5
This comment references infill opportunity zone policies cited in the 2009 EIR. The City of Concord addressed this comment in the 2010 RTC, indicating that the reference to Infill Opportunity Zone was removed in the Final EIR because a city or county cannot designate an Infill Opportunity Zone by law after December 31, 2009. As a result, Infill Opportunity Zone policies are not referenced in the Navy's EIS.

0010-5

0010-6
The intent of this comment is to ensure the forecasted volumes used in the 2009 EIS for State Route 4 were consistent with that in the State Route 4 Corridor Systems Management Plan (CSMP). The comment requested 2030 forecasted freeway volumes be reported so that consistency between the two reports could be determined. The City of Concord addressed this comment in the 2010 RTC. The City of Concord indicated that

0010-6

the requested freeway volumes were provided in Appendix 4E of the Final EIR.

The CSMP was completed in October 2010; therefore, this comment does not directly apply to the Navy's EIS. In the context of the Navy's EIS, traffic counts from the SR4/SR242 Ramp Metering Implementation Study were used, and forecasted volumes were derived from the updated CCTA travel demand model, which incorporated recommendations and improvements from the CSMP to the extent those improvements were funded and included in the latest Countywide Transportation Plan. Therefore, the DEIS utilized the most recent count data and forecasting model to develop the forecasted volumes used in the transportation analysis.

Route 4. TRANSPLAN Staff, in attempting to determine the consistency of the DEIR with the CSMP, found no common metric between the two. Please either provide the 2030 forecasted freeway volumes so that staff may validate the figures, or include a comparison in the next iteration of environmental report.

6. *Page 4-30: Roadway Segments:* TRANSPLAN has included in the *East County Action Plan for Routes of Regional Significance* language[1] establishing the intent to readdress the status of Bailey Road with the next update to the Action Plan. Subsequent planning by the City should anticipate that at the time of development, Bailey Road will be a designated Route of Regional Significance.

7. *4.1.3.3: Traffic Service Objectives: Page 4-33:* The sentence "*The target is meant to be applied to a corridor; while individual segments may violate the target DI*" is not consistent with the East County Action Plan which, in the context of Delay Index, refers to "segments" not "corridors". The June 20, 2000 version of the East County Action Plan which was in force at the time the Notice of Preparation was developed, does not provide for a "corridor" analysis.

8. *4.1.4: Transit: Page 4-35: "The transit system serving Contra Costa County is well-developed in urbanized areas...":* The DEIR must disclose relevant information regarding the current state of transit funding in order for this EIR to be considered complete. This is addressed in more detail throughout this letter.

9. *4.3 Potential Transportation Impacts: Page 4-49:* See comment# 3 above. The exclusion of the "Existing Plus Project" (EPP) scenario was discussed with the TRANSPLAN Technical Advisory Committee (TAC) meeting on 9/15/09, in addition to the earlier comment on regarding analysis scenarios. The DEIR includes a long explanation of why its evaluation of potential project impacts varies from "standard practice" so the DEIR will not "grossly overstate actual impacts". Yet, the DEIR's approach is characterized as being "very conservative, and tends to overstate actual impacts of the alternatives compared to what a pure 'Existing plus Project' approach would yield." The TAC is somewhat confused by the DEIR's use of scenarios to determine potential transportation impacts. We request that TRANSPLAN be consulted in subsequent studies that will determine the project's contribution to improvements that mitigate its impact on regional routes.

10. *4.3.3 Model Forecast Methodology: Page 54:* Please disclose what the results of the model runs were in terms of the (effective) trip generation rates and mode splits for all land use types in the proposed project. In addition, please provide details regarding the adjustments to the model to improve the transit sensitivity summarized at the top of page 4-54. The observed results of those edits (change in mode split, BART access mode, etc) should be disclosed in order to determine the reasonableness of the changes. Given that the impacts (and corresponding scale of mitigation necessitated by said impacts) hinge largely on these figures, the City should be prepared to reevaluate the mitigation measures if higher rates are warranted. New impacts could be identified and existing impacts exacerbated if this is the case. Reiterating points made in more detail elsewhere in this letter and in TRANSPLAN's 7/16/08 comment letter, that adequate bus service and/or BART capacity will exist in the future has not been verified. Detail on how the mode split was arrived at should be provided. Was it developed using model output or was a certain mode split assumed (based on comparable areas) and the figures extrapolated from this assumption?

11. *4.3.3.2 On-Site Transit Network: Page 4-54:* Please provide letters of commitment from County Connection and Tri Delta Transit that validate the transit service suggested in this section. In addition, adequate capacity for BART in the anticipated timeframe of project needs to be established (See comment #16). Without this information, the transit mode share assumed in the EIR may be infeasible and the proposed service may not be attractive to future residents and workers housed by the project.

[1] *"With future updates to the East County Action Plan, TRANSPLAN will work with TRANSPAC to consider the utility of Bailey Road and the need to designate the section from West Leland Road to the TRANSPAC region a Route of Regional Significance."*

0010-6 cont'd
Please see previous page for response.

0010-6
Continued

0010-7

0010-7 TRANSPLAN's comment letter was originally submitted in response to publication of the 2009 EIR. The 2009 letter was resubmitted by the City of Antioch during the comment period for the Navy's 2014 DEIS.

0010-8

At the time when the analysis started for the 2009 Reuse Plan EIR, TRANSPAC and TRANSPLAN had adopted Action Plans for Routes of Regional Significance (RRS) that included several

0010-9 Transportation Service Objectives (TSOs) to measure the effectiveness of regional freeways, arterial routes, and transit use. The TSOs for East and Central County included the delay index, level of service (LOS), average travel speed, average

0010-10 vehicle occupancy, and transit ridership, which are described in EIR Section 4.1.3.4 and Table 4-14. However, prior to completion of the Final EIR, Central and East Contra Costa County had drafted Action Plans, which replaced the TSOs with Multi-modal Transportation Service Objectives (MTSOs). Both TSOs and MTSOs are presented in the Final EIR.

At the time of preparation of the TIS for the Navy's EIS, Bailey Road was considered an RRS (see FEIS Appendix H, Sections

0010-11 3.1.2 and 4.2) and as such the MTSOs for Bailey Road were applied, consistent with the East County Action Plan for Routes of Regional Significance (2009). To the extent information was available from the 2014 Action Plan, which was still in draft form when the TIS analysis was conducted, updated MTSOs were included. MTSOs are listed in Table 4.11-7 of the EIS; the analysis results are discussed in Sections 4.11.2 and 4.11.3.

0010-8

0010-12 The comment is disputing the approach to calculating the Delay Index as one of the TSOs from the June 20, 2000 version of the East County Action Plan. By the time the EIS analysis was conducted, the 2000 version of the East County Action Plan was no longer applicable. During the time when the EIR was developed, Central and East Contra Costa County had prepared draft Action Plans for Routes of Regional Significance (RRS), which replace the TSOs with MTSOs from the 2009 version of the Action Plan. Therefore, MTSOs were applied in the DEIS. MTSOs are listed in DEIS Table 4.11-7; the analysis results are discussed in sections 4.11.2 and 4.11.3. The Delay Index

represents the ratio of congested travel time to uncongested travel time between two points and can be applied on an individual segment basis or to an entire corridor. For the DEIS, the Delay Index is reported for the corridor, which is similar to what is reported in the 2009 Action Plan (as well as the draft 2014 Action Plan). Additional details on the results of the MTSOs are presented in Tables 26 and 27 of the TIS (included as Appendix H of the FEIS).

0010-9
Please see response to Comment 10-1 for information regarding transit funding.

0010-10
Please see response to Comment 10-4 for information regarding the DEIS analysis scenarios and Comment 24-14 for information regarding the EIS and transportation mitigation measures. The City of Concord will coordinate with affected jurisdictions on specific mitigation measures prior to the approval of a development plan or discretionary entitlement at the former NWS Concord site.

0010-11
This comment is referring to the transportation model methodology used in the 2009 EIR. The concern expressed in the comment about specific adjustments made to the model used for the 2009 Draft Reuse Plan EIR transportation analysis is not relevant to the EIS analysis. The DEIS transportation analysis used the CCTA Countywide Model, which updated the earlier model to include adjustments to improve the transit sensitivity. This is described in Section 4.1 of the TIS. Since the DEIS transportation analysis utilized a travel demand model, trip generation and mode split is not available by land use types but, rather, traffic analysis zones (TAZs). Multiple land use types are included in each TAZ. This approach allowed the DEIS transportation analysis to better capture the interactions between the trip-making patterns of the project land uses and the surrounding land uses and transportation system. Additional details on this approach are provided in the TIS Section 4.1. Mode share is presented in Table 19 and described in Section 4.1. A summary of the EIS transportation analysis methodology, including trip generation, trip distribution and travel mode, is presented in Section 4.11.1 of the FEIS.

0010-12
Originally submitted in response to publication of the 2009 Draft EIR, this comment refers to the transit service commitment related to the 2009 alternatives and adequate capacity for BART in the timeframe of the project. See response to Comment 10-1 for information regarding City of Concord transit funding commitments. The DEIS transportation analysis used the updated CCTA Countywide Model, which includes transit services and facilities, such as BART, County Connection, and Tri Delta Transit. Using the updated CCTA model provided the best available data at the time of the DEIS since capacity assumptions, frequency of service, bus routes and stops are embedded in the model. The on-site roadway network serving the project site is described in Figures 1 and 2 in the TIS. New transit service to the North Concord BART station serving the project site was assumed in the CCTA model, based on the bus service assumed in the EIR. For the North Concord BART station, the Proposed Action provides new residences and jobs in close proximity to the station, thus providing increased ridership, particularly in the reverse-commute direction, which is not as constrained as the peak commute direction, e.g., toward Oakland and San Francisco in the morning and from Oakland and San Francisco in the evening. The CCTA model included the East Contra Costa BART Extension (eBART) as well as a new bus line to serve the project site.

To address system and station capacity issues, particularly, in the San Francisco and Oakland stations, BART, in collaboration with the Metropolitan Transportation Commission (MTC), the San Francisco Municipal Transportation Agency (SFMTA), the San Francisco County Transportation Authority (SFCTA), and the Alameda-Contra Costa Transit District (AC Transit) are conducting the Core Capacity Study. In addition, BART has prepared the FY15-FY24 Short Range Transit Plan and Capital Improvement Program, which addresses capital and operating needs.

12. *4.3.3.3 On-Site Bicycle and Pedestrian Network: Page 4-63:* Consistent with comments provided in TRANSPLAN's 7/16/08 comment letter, excluding Class II and III facilities at this point in the project development process is understandable. However, the Reuse Plan should include a policy statement establishing that a dense, well-connected bikeway network will be produced at some point further in the project development process.

13. *4.3.4 Assumptions about Potential Impacts with Respect to Transportation: Page 4-63:* Reiterating comment #2 above, relying exclusively on TDM measures to mitigate transportation impacts is a significant departure from local practice and is not supported in current local, regional and state policies. TRANSPLAN is committed to addressing the goals of SB 375, at the appropriate time and in the appropriate manner. The decision to take this approach by the City is premature in the absence of locally relevant, adopted policies. As indicated in comment 2f, an extraordinary effort on the part of the City to ensure the effectiveness of TDM strategies may result in a measurable change in travel behavior but does not justify disposing of any capacity improvement to mitigate the project's impacts to regional routes.

14. *Figure 4-12, 4-13: Page 4-65, 4-67:* In subsequent planning efforts the City should consider the following comments on the non-motorized network from our TRANSPLAN members. The existing Class I trail does on Port Chicago Highway does not go north of State Route 4. This map should show this section of trail as proposed. The following facilities should be added to the non-motorized network depicted in these figures (in addition to the improvements discussed on comment #1):

    1. An extension of the existing Class I facility on Willow Pass Road to Highway 4 and the planned Class I and II on Evora Road. [there already is a Class I parallel and to the east of WP Rd]
    2. Class II facilities on Arnold Industrial Way between Port Chicago Highway and Solano Way and connections to these facilities from the project site. [the map has no Class II routes. Are they shown on another map?]
    3. Class II facilities on Bailey Road to connect to the planned Class II facilities in unincorporated County and the existing Class II in the City of Pittsburg in the north and connect to the trail in Newhall Community Park.
    4. Class II on Kirker Pass Road to connect to the planned Class II in the unincorporated County in the north and the existing Class II on Clayton Road.

15. *4.3.4 Assumptions about Potential Impacts with Respect to Transportation: Page 4-63:* Project #4 is described as "Evora Road: Widen from Willow Pass to Pomo Street and extend to Port Chicago Highway". Figure 4.14 is not consistent with this project description. Please clarify whether the extension to Port Chicago Highway is No-Project condition or part of the project. TRANPLAN believes this connection is critically needed to provide an alternate route to State Route 4.

16. *4.3.5.1 Transit Ridership Forecasts: Page 4-72:* Please provide some assurance that bus service will be available in the future and that BART will have sufficient capacity to serve the project and not compromise ridership further down the BART line.

    After the last Transportation Advisory Group meeting in 2008 there were questions as to whether or not BART had the capacity to carry the increased riders. The outcome of these discussions was that there were to be additional analysis and meetings to address BART capacity. No analysis results or capacity information has been distributed or can be found in the EIR. Please provide the results of this additional analysis.

    Regarding bus transit, the lack of relevant information related to the state of transit funding will compromise the LRA's ability to make an informed decision on this project. There is substantial evidence that there will not be adequate resources in the future to provide the level of bus service assumed in the EIR.

Staff Contact: John Cunningham; Phone: 925.335.1243 | Fax: 925.335.1300 | john.cunningham@dcd.cccounty.us www.transplan.us

0010-13

Originally submitted in response to publication of the 2009 Draft EIR, this comment indicates that the Reuse Plan should include a policy statement related to the development of a dense, well-connected bikeway network on the former NWS Concord site. The City of Concord addressed this comment in the 2010 RTC. The Master Response Transportation 1 in the 2010 RTC explained the Draft Reuse Plan EIR's approach to analyzing pedestrian and related future planning efforts.

The City of Concord refined the Reuse Plan in 2012 and adopted the resulting Area Plan. The Area Plan includes policies related to developing a well-connected bicycle network (i.e., Policy T-1.2: Bicycle and Pedestrian Connections, and Policy T-1.5: Bicycle and Pedestrian Safety). Alternative 1, as identified in the Navy's 2014 DEIS, is the reuse of the former NWS Concord in a manner consistent with the Area Plan.

0010-14

Originally submitted in response to publication of the 2009 Draft EIR, this comment refers to the City of Concord's plan to implement TDM strategies as a mitigation measure in the 2009 Draft Reuse Plan EIR. Please see the response to Comment 24-14 for information regarding the EIS and transportation mitigation measures.

0010-15

This comment references modifications to figures in the 2009 EIR. A data request for bicycle network GIS data was submitted to the Contra Costa Transportation Authority in September 2015 and the City of Concord in March 2017 to ensure the most recent data was incorporated in the FEIS. FEIS Figure 3.11-5, Bike Trails, was revised to depict the off-site bicycle network from the most recent Contra Costa Countywide Bicycle Master Plan GIS data (completed in 2010) and the City of Concord's proposed bikeway network from Concord's Bicycle, Pedestrian & Safe Routes to Transit Plan (completed in 2016). Both existing and proposed regional countywide routes and jurisdictional routes based on the local bike plans of incorporated towns and cities are depicted in Figure 3.11-5.

0010-16

The Evora Road project "Widen from Willow Pass to Pomo

Street" is part of the improvements assumed to be in place in the updated CCTA model used for the Navy's 2014 DEIS. The extension of Evora Road to Port Chicago Highway was part of the roadway network for Alternative 1 and 2, as shown in Figures 1 and 2 in the TIS.

0010-17
Please see response to Comment 10-1 for information regarding transit funding and Comment 10-12 for information regarding BART capacity.

TRANSPLAN does not necessarily see this as a flaw; examples of mechanisms (County Service Area[2]) to fund transit exist in the County. These mechanisms could also be used to purchase TransLink passes for residents of the development or be dedicated to funding quality bus service as is assumed in the DEIR. Both of these actions are likely to substantially increase transit mode share, demonstrate the City's commitment to implementing mitigation measures, ensuring TDM measures are feasible and effective, and be consistent with the goal of creating a world class project. (see comment 2f).

17. *4.3.5.3 Summary of Transportation Impacts: Page 4-88:* The information on this page (*"Common strategies to limit impacts....include...new roadway infrastructure...")* conflicts with other areas of the document which state that *"the City...will implement transportation demand management strategies to mitigate ...rather than mitigating impacts through increased capacity..."*. The next version of the EIR should fulfill the project sponsors obligation[3] to evaluate feasible mitigations measures and present a reasonable plan[4] for mitigation. These responsibilities exist regardless of pending environmental policies or any future action by the LRA. The Contra Costa Countywide Transportation Plan can provide a starting point of potentially feasible and effective measure to mitigation the project's impacts on regional routes. Appendix B of that plan identifies State Route 4/I-680 interchange improvements and connection of State Route 4 carpool lanes with the I-680 carpool lanes that could mitigate the project's impact on regional routes. Some of these improvements would also support the TDM goals of the Reuse Plan. It is the hope of TRANSPLAN jurisdictions that this list would be developed in the multi-jurisdictional collaborative tradition that has served Contra Costa County so well.

18. *4.3.6.1 Potentially Significant Project-Specific Transportation Impacts of the Preferred Alternative That Worsen the Future Condition and Remain Significant after Mitigation: Page 4-107: Impact Transportation 1: Mitigation Measures (MM) 1 and 2*: In addition to determining fair share cost of planned improvements the project sponsor should work with Caltrans to determine what additional feasible mitigation measures are possible and apply a fair share cost to those improvements as well.

19. *Page 4-111: Impact Transportation 4: Locations 7, 8, 9, 10 and 11, Page 4-116: Impact Transportation 05, Page 4-131: Impact Transportation 26, Page 4-123: Impact Transportation 12, Page 4-135: Impact Transportation 29, Page 4-140: Impact Transportation 29, Page 4-145: Impact Transportation 36, Page 4-149: Impact Transportation 39:* The project sponsor should work with affected jurisdictions to identify ***additional*** mitigation measures. This would facilitate a reasonable mitigation plan which would further (in addition to planned improvements) reduce the impact of the project. Given the lack of an adopted plan for the study area, combined with the likely build-out timeframe of the project, it is unreasonable to assume that capital improvements would be currently planned that would provide mitigation for the as-of-yet-adopted plan ***and*** the additional background traffic and rely on that absence of improvements to seek relief through measures other than capacity increasing. That valid mitigation measures are not currently planned does not preclude the project sponsor from developing them. Valid mitigation measures, those that exist in current plans, can be found in the *Countywide Comprehensive Transportation Plan* and the *Corridor Systems Management Plan*. Consistent with the proposal to rely on existing planned projects, please evaluate relevant projects from these plans and include them in the yet to be developed funding plan.

20. *Page 4-123: Mitigation Measure Transportation 11, Intersection Impact Location 5*: Regarding the study referenced in this section, there are two planning efforts under way, one for Bailey from Leland Avenue to the freeway interchange, and one from the freeway interchange north to Willow Pass Road. The City of Pittsburg is the lead agency for the former, and Contra Costa County is the lead agency for the latter. The City and the County are coordinating these efforts with each other. Participants include Caltrans, BART, Tri Delta Transit and the East Bay Regional Park District. The goal of these planning efforts is to

[2] County Service Area T-1 in the Alamo Creek subdivision provides funding to provide transit service to the development. The annual assessment ranges from $318 to $230 depending on housing type. More information is available from the Contra Costa County Public Works Department: Hillary Heard: 313-2022

[3] Public Resources Code section 21002

[4] Save Our Peninsula Committee v. Monterey County Board of Supervisors (2001)

0010-18

Originally submitted in response to publication of the 2009 Draft EIR, this comment refers to the City of Concord's plan to implement TDM strategies as a mitigation measure in the 2009 EIR. Please see response to Comment 24-14 for information regarding the EIS and transportation mitigation measures.

0010-18 0010-19

Originally submitted in response to publication of the 2009 Draft EIR, this comment refers to the City of Concord's plan to implement TDM strategies as a mitigation measure in the 2009 Draft Reuse Plan EIR and coordination with Caltrans to determine additional feasible mitigation measures and their fair share cost. As indicated in the response to Comment 24-14, Table 7-1 of the FEIS has been revised to incorporate additional detail on TDM strategies and the coordination with affected jurisdictions that will be required as part of the City of Concord's adopted MMRP process addressing physical roadway improvements.

0010-19

In relation to determining a fair share cost for improvements, the City of Concord committed in the 2010 MMRP to conducting a

0010-20 "Nexus Study, required pursuant to the Mitigation Fee Act, for the entire former NWS Concord site to establish an equitable traffic impact-fee rate for each land use category to ensure that future development projects will contribute a fair share of the unfunded costs of planned improvements and mitigation measures determined by the City of Concord in consultation with the affected jurisdictions." Therefore, the City of Concord will work cooperatively with affected jurisdictions, including Caltrans, to determine feasible improvements as part of the Nexus Study. In the MMRP, the City of Concord also committed to requiring future developers to "contribute a traffic-impact fee in accordance with the TRANSPAC Subregional Transportation Mitigation Fee Program requirements of the Central County Action Plan for

0010-21 Routes of Regional Significance" as well as other funding agreements, such as the Bailey Road Traffic Mitigation Measures Inter-Agency Funding Agreement and the East Central Traffic Management Study. The DEIS references the City of Concord's Nexus Study and the traffic-impact fee in accordance with the TRANSPAC Subregional Transportation Mitigation Fee Program in Section 4.11.2 and Table 7-1.

0010-20

Originally submitted in response to publication of the 2009 Draft

EIR, this comment refers to the City of Concord's plan to implement TDM strategies as a mitigation measure in the 2009 Draft Reuse Plan EIR. Please see response to Comment 24-14 for information regarding the EIS and transportation mitigation measures.

0010-21
The City of Concord noted this comment in the 2010 RTC and added a sentence to Mitigation Measure Transportation 11, Intersection Impact Location 5 in the Final EIR: "The improvements, however, are intended to improve the pedestrian, bicycle, and aesthetic environment along Bailey Road; no increase in vehicle capacity is planned."

The planning efforts mentioned in the comment do not directly apply to the Navy's EIS since they pertain to portions of Bailey Road located outside of the former NWS Concord site and address streetscape improvements rather than capacity increases for motor vehicles. However, the DEIS provides an overview of pedestrian and bicycle facilities as they pertain to the former NWS Concord (see Section 3.11.6) and identifies the regional bicycle network in Figure 3.11-3, Bike Trails. This figure has been renumbered to Figure 3.11-5 in the FEIS and updated to reflect the off-site bicycle network from the most recent Contra Costa Countywide Bicycle Master Plan GIS data (completed in 2010) and the City of Concord's proposed bikeway network from Concord's Bicycle, Pedestrian & Safe Routes to Transit Plan (completed in 2016). FEIS Figure 3.11-5 includes bicycle facilities along Bailey Road.

improve the pedestrian, bicycling and aesthetic environment along Bailey Road. They are not intended to increase capacity for motor vehicles.

21. *Page 4-132: Impact Transportation 27:* That responsible agencies currently do not have projects identified to mitigate the impact of the proposed project (the build-out of which likely exceeds the horizon year of most capital improvement plans if not general plans) does not free the project sponsor from the responsibility to evaluate feasible mitigation measures and a reasonable implementation plan. This responsibility exists whether the City decides to fund the mitigation measures or not. The project sponsor should work with the affected jurisdictions, as was suggested with other identified impacts, to develop additional mitigation measures.

22. *Page 4-147: Impact Transportation 38:* Location 5: TRANSPLAN is encouraged that the City of Concord will work cooperatively with the City of Pittsburg in developing appropriate improvements. Please be aware however that the Pittsburg/Bay Point BART Station Pedestrian/Bicycle Access Plan will not be examining the types of improvements necessary to mitigation the identified impact. A separate study or process will be necessary to determine appropriate improvements.

23. *Page 4-155: Impact Transportation 49*: As stated in TRANSPLAN's 7/16/08 comment letter and elsewhere in this letter, the statement "Transit service will increase..." cannot be accurately made in the absence of an identified ***additional,*** ongoing transit operations funding mechanism or, at a minimum, a policy statement requiring the development of such a funding stream as a requirement of any development. Absent this identified funding, any benefits and increases in service need to be re-characterized as an impact (creation of demand) in addition to identified mitigations. The City's approach would be analogous to stating that automobile access would be provided by way of a roadway in the absence of any plans or funding to construct it. Again, there are examples of mechanisms to fund transit in conjunction with development. Please see comment 2f. The unique timing of this project, a blank slate for a new BART station area while concerns about greenhouse gas emissions abound, is a rare opportunity which should not be squandered. The City should seize the chance to innovate by providing transit supportive land development patterns and ***while*** ensuring quality transit service will be present to serve the project.

24. *Page 4-155: Impact Transportation 50*: Again, without a plan that connects the internal non-motorized network to an external (adequate) non-motorized network the project, at best, will create an unmet demand for non-motorized facilities. At worse it will create an unsafe situation by having cyclists connect to facilities not suited to bicycle use.

0010-22

Originally submitted in response to publication of the 2009 Draft EIR, this comment refers to the City of Concord's plan to implement TDM strategies as a mitigation measure in the 2009 Draft Reuse Plan EIR. Please see the response to Comment 24-14 for information regarding the EIS and transportation mitigation measures.

0010-23

Originally submitted in response to publication of the 2009 Draft EIR, this comment refers to the mitigation measures proposed in the 2009 EIR at the intersection of Bailey Road and SR 4 eastbound ramps. As indicated in Table 4-11.9 of the Navy's FEIS, physical improvement measures the City of Concord may consider in accordance with the adopted MMRP at the intersection of Bailey Road and SR 4 eastbound ramps include:

-Convert the EB through lane to an exclusive left turn lane from the BART access road; and widen the SR-4 EB off-ramp to add a right-turn lane in order to provide one left-turn lane, one shared left through lane, and two right-turn lanes on the WB approach;

-Replace one of the SB left-turn lanes with one left turn lane, two through lanes, and one right-turn lane on the SB approach; and

-Modify the traffic signal to provide protected left-turn phasing.

0010-24

Please see response to Comment 10-1 for information regarding transit funding.

0010-25

Please see response to Comment 10-2 for information regarding the connections between the internal and external non-motorized network.

Subject: Draft Environmental Impact Statement for the Disposal and Reuse of the Former Naval Weapons Station Seal Beach Detachment Concord, Concord, California (CEQ# 20140289)

Dear Ms. Spinelli:

The U.S. Environmental Protection Agency (EPA) has reviewed the above-referenced document pursuant to the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations (40 CFR Parts 1500-1508), and our NEPA review authority under Section 309 of the Clean Air Act. Our detailed comments are enclosed.

The Draft Environmental Impact Statement (DEIS) assesses the impacts of the Navy's disposal of surplus property at the former Naval Weapons Station Seal Beach Detachment Concord and subsequent redevelopment of the property by the City of Concord. The preferred alternative is the development plan adopted in 2012 by the City of Concord in the Concord Reuse Project Area Plan. The approved development plan supports transit oriented development around the North Concord/Martinez BART Station where higher intensity uses are planned, transit use in other developed areas of the site, and includes open space, greenways, and a bicycle network. EPA recognizes and supports the transit-oriented focus and open space preservation components of the proposed development. Nevertheless, we believe that the environmental impacts of the project warrant further consideration and mitigation.

Based on our review, we have rated the DEIS's preferred alternative as *Environmental Concerns – Insufficient Information* (EC-2) (see enclosed "Summary of Rating Definitions"). The development plan would remove 22 acres of wetlands, which would eliminate their important values to fish and wildlife, and their functions as storage areas for flood flows, groundwater recharge, nutrient recycling, and water quality improvement. We understand that the City of Concord will apply for a Clean Water Act Section 404 permit from the Army Corps of Engineers. EPA will work with the Corps when the Clean Water Act Section 404 permit is proposed to help ensure that these impacts are minimized. Please see our attached recommendations for improving the disclosure of impacts and regulatory processes in the Final EIS. We understand that all mitigation for impacts of the proposed project will be the responsibility of the City of Concord. Since impacts to air quality are described in the DEIS as significant, we recommend that the City ensure that robust air quality mitigation measures are implemented, and we encourage the Navy to work with the City to secure appropriate commitments to such measures.

EPA appreciates the opportunity to review this DEIS. When the Final EIS is released for public review, please send one copy to the address above (mail code: ENF-4-2). If you have any questions, please

0011-1

0011-1

The City of Concord conducted a comprehensive review and selection process through the California Environmental Quality Act (CEQA) to identify the preferred alternative, the Area Plan. The City Council adopted the Concord Reuse Project Area Plan (Area Plan) in 2012 and amended the Area Plan into the City's 2030 General Plan and certified a Final EIR in 2012. This process involved considering alternatives that would provide a viable future development project while minimizing impacts on the environment.

The City of Concord has submitted an Individual Permit application under the Clean Water Act (CWA) to the USACE with the goal of securing a site-wide permit that authorizes the fill of 6.93 acres of waters of the U.S. in connection with future economic development, the restoration of Mt. Diablo Creek, and habitat enhancements for federal and state listed species. According to the City's pending Individual Permit application and the USACE's Public Notice for the application (published June 14, 2016), economic development would result in the permanent fill of 4.23 acres of wetland and 1.42 acres of other Waters of the U.S.; the total (temporary and permanent) fill estimate is 6.93 acres (4.50 acres of wetlands and 2.43 acres of other Waters of the U.S).

The restoration of Mt. Diablo Creek and conservation enhancements for endangered species will fill 0.27 acres of wetlands and 1.01 acres of other Waters of the U.S. However, the restoration and conservation activities will also produce additional aquatic resources areas, reducing the net loss of jurisdictional waters from implementing the Area Plan to a net loss of 4.23 acres of wetland and 1.43 acres of other waters. The USACE will evaluate the City's application for compliance with the 2008 Federal Compensatory Mitigation Rule and for compliance with the Section 404(b)(1) Guidelines and the USACE's regulations (33 CFR Part 325), which require the USACE to identify and analyze project alternatives, and select the alternative that avoids and minimizes impacts to jurisdictional waters to the maximum extent practicable, and is the least environmentally damaging practicable alternative that achieves the overall project purpose. The Navy concurs with the EPA's statement that compliance with the 404(b)(1) Guidelines will be evaluated by the USACE independent of City approvals, during the 404 permitting process. If the City does not secure a site-wide Individual Permit, future property owners or developers would be responsible for securing any necessary CWA permits from the USACE, and any applications for an Individual Permit

would be subject to the 404(b)(1) Guidelines and the Compensatory Mitigation Rule.

contact me at (415) 972-3521, or contact Karen Vitulano, the lead reviewer for this project, at 415-947-4178 or vitulano.karen@epa.gov.

Sincerely,

FOR Connell Dunning

Kathleen Martyn Goforth, Manager
Environmental Review Section

Enclosure: Summary of EPA Rating Definitions
EPA's Detailed Comments

cc: Jane M. Hicks, Army Corps of Engineers
Michael W. Wright, City of Concord

SUMMARY OF EPA RATING DEFINITIONS

This rating system was developed as a means to summarize EPA's level of concern with a proposed action. The ratings are a combination of alphabetical categories for evaluation of the environmental impacts of the proposal and numerical categories for evaluation of the adequacy of the EIS.

ENVIRONMENTAL IMPACT OF THE ACTION

"LO" (Lack of Objections)

The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

"EC" (Environmental Concerns)

The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impact. EPA would like to work with the lead agency to reduce these impacts.

"EO" (Environmental Objections)

The EPA review has identified significant environmental impacts that must be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

"EU" (Environmentally Unsatisfactory)

The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potentially unsatisfactory impacts are not corrected at the final EIS stage, this proposal will be recommended for referral to the CEQ.

ADEQUACY OF THE IMPACT STATEMENT

Category 1" (Adequate)

EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alternative and those of the alternatives reasonably available to the project or action. No further analysis or data collection is necessary, but the reviewer may suggest the addition of clarifying language or information.

"Category 2" (Insufficient Information)

The draft EIS does not contain sufficient information for EPA to fully assess environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analysed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

"Category 3" (Inadequate)

EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analysed in the draft EIS, which should be analysed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data, analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.

*From EPA Manual 1640, "Policy and Procedures for the Review of Federal Actions Impacting the Environment."

EPA DETAILED COMMENTS ON THE DRAFT ENVIRONMENTAL IMPACT STATEMENT, DISPOSAL AND REUSE OF THE FORMER NAVAL WEAPONS STATION SEAL BEACH DETACHMENT CONCORD, CONCORD, CALIFORNIA, NOVEMBER 24, 2014

Wetlands and Waters of the U.S.

The proposed development plan would fill approximately 16.1 acres of jurisdictional wetlands, including freshwater marsh and seasonal wetlands; 6 acres of non-jurisdictional wetlands; and approximately 8,716 linear feet of streams that lie within the development footprint (p. 4-168, 4-174). We have concerns with this level of impact from the direct fill of wetlands and streams, as well as the indirect impact of adding over 1,100 acres of new impervious surface to the watershed[1]. The DEIS references a Master Clean Water Act Section 404 permit that would establish the city as the responsible party for U.S. Army Corps of Engineers (USACE) permitting requirements. There is no "Master" 404 permit within Clean Water Act Section 404 permitting options, and the DEIS may be referring to a Regional General 404 permit.

Before issuing a 404 permit, the USACE will have to determine that impacts have been avoided and minimized to the maximum extent practicable. The information in the DEIS does not demonstrate that the City's redevelopment plan is the Least Environmentally Damaging Practicable Alternative per Section 230.10(a) of the EPA 404(b)(1) Guidelines. It appears that additional avoidance is possible. In addition, the 404 permit must include compensatory mitigation requirements for unavoidable impacts, in compliance with the 2008 Federal Mitigation Rule. EPA will provide additional comments on specific development proposals through the USACE Public Notice process.

Recommendation: We recommend that the following information be included in the FEIS:

- Clarify in the FEIS whether the "Master" 404 permit refers to a Regional General 404 permit. Indicate the status of the permit and describe the process whereby the City would comply with USACE permitting requirements.
- In Section 3.14.1.2, discuss the EPA 404(b)(1) Guidelines and how the USACE uses them to evaluate proposed permits, as well as the 2008 Federal Compensatory Mitigation Rule. This section currently only discusses the jurisdictional determination process in any detail, but that is only the first step in the permitting process.
- In Sections 4.14.1.2 and 4.14.2.2, state that, under the 404(b)(1) Guidelines, impacts to waters of the U.S. must be avoid and minimized to the maximum extent practicable. Compliance with this requirement will be evaluated by the USACE, independent of City approvals, during 404 permitting.
- Explain how the City plans to mitigate for impacts to 22 acres of wetlands and fill of over 1.5 miles of streams. For example, will mitigation be provided within the plan area, within the same watershed, outside the watershed, or through mitigation banks, etc.? It is not sufficient disclosure to say only that developers will have to comply with state and federal regulations.
- Clarify whether the "Concentration & Conservation" alternatives evaluated in the City's CEQA document were considered in the DEIS.

[1] Full project estimate is 1,442 acres of impervious surface; 359 acres currently exist (p. 4-169)

0011-2

0011-3

0011-4

0011-5

0011-6

0011-7

0011-8

0011-9

0011-2
The City of Concord has submitted an Individual Permit application under the CWA to the USACE with the goal of securing a site-wide permit for future development activities. This submittal included a Conceptual Habitat Mitigation Plan for Wetland, Aquatic, and Riparian Habitats. As described in the USACE's Public Notice, the City's development would avoid the largest jurisdictional wetlands on the site (two seasonal wetland features totaling approximately 8 acres near the old airfield and the majority of the Holbrook Drainage Channel (~ 1 acre), which is a vegetated ditch that flows along the north side of Willow Pass Road. In addition, fill impacts to Mt. Diablo Creek would be minimized by using clear-span bridges for the 9 planned new vehicle or pedestrian crosssings. Unavoidable fill would be mitigated through the creation of new wetland areas within NWS Concord; a total of 0.59 acres of new wetland area would be created in association with expansion and enhancement of existing California tiger salamander breeding ponds. In addition, the City is proposing to create up to 10 acres of new wetlands near the old airfield and enhance Mt. Diablo Creek. The Public Notice further acknowledges that a final mitigation plan would be required prior to the issuance of any Individual Permit.

0011-3
During the preparation of the DEIS, the City of Concord was discussing various options for CWA permitting with the USACE, including the potential for some form of site-wide permit (e.g., the term in discussion was a "Master" permit). Since that time, the City of Concord has submitted an Individual Permit application under the CWA to the USACE with the goal of securing a site-wide permit for future development activities. That Individual Permit is currently under review by the USACE. If the City is able to secure a site-wide permit from the USACE that is certified by the RWQCB, the permit conditions would include measures to adequately avoid, minimize, and mitigate for any adverse impacts on wetlands or Waters of the U.S. If the City does not secure site-wide permits, future property owners or developers would be responsible for securing any necessary state or federal resource permits and would have to demonstrate to the applicable resource agencies that impacts on wetlands, streams, riparian habitats, and listed species or their habitat have been minimized.

0011-4

The discussion of wetland and Waters of the U.S. presented in the FEIS has been revised to include a description of how the USACE is evaluating the Least Environmentally Damaging Practicable Alternative for the project. In June of 2016, the USACE issued a Public Notice discussing their evaluation of a site-wide Individual Permit for the Area Plan. The current project description includes avoidance of a large wetland and the majority of the Holbrook Drainage Channel in the Economic Development Conveyance area.

0011-5

Sections 3.14.1, 4.14.1.1, and 4.14.1.2 of the FEIS have been revised to further describe the permitting process. The City of Concord has submitted an IP application under the CWA to the USACE with the goal of securing a site-wide permit for future development activities.

0011-6

The City of Concord conducted a comprehensive review and selection process through the California Environmental Quality Act to identify the preferred alternative, the Area Plan. The City Council adopted the Concord Reuse Project Area Plan in 2012 and amended the Area Plan into the City's 2030 General Plan. This process involved consideration of alternatives that would provide a viable future development project while minimizing impacts on the environment.

Section 3.14.1.2 has been revised to further describe the permitting process. The City of Concord has submitted an Individual Permit application under the CWA to the USACE with the goal of securing a site-wide permit for future development activities. Through review of this Individual Permit, the USACE would ensure that the CWA 404(b)(1) Guidelines are met in order to issue a permit. In addition, the USACE would ensure that any necessary compensatory mitigation would comply with the 2008 Federal Compensatory Mitigation Rule. If the City does not secure a site-wide permit, future property owners or developers would be responsible for securing any necessary state or federal resource permits and would have to demonstrate to the USACE and USEPA that impacts on Waters of the U.S. are avoided, minimized, and mitigated, as necessary under 404(b)(1) Guidelines and that any compensatory mitigation would be consistent with guidelines in the 2008 Federal Compensatory Mitigation Rule.

0011-7
Sections 4.14.1.2 and 4.14.2.2 have been updated to reflect the status of the USACE 404 process and include information regarding planned mitigation activities. The USACE Public Notice indicates that the City's development would avoid the largest jurisdictional wetlands on the site, and compensatory mitigation for unavoidable fill impacts (4.23 acres of wetlands and 1.42 acres of other Waters of the U.S.) is proposed on site. A new wetland (0.59-acres in size) would be created in association with the expansion and enhancement of existing California tiger salamander breeding ponds. In addition, the City is proposing to create up to 10 acres of new wetlands downstream of a spring near the old airfield and enhance Mt. Diablo Creek. The USACE Public Notice provides more detailed information including maps.

0011-8
Please see response to comment 0011-7.

0011-9
The alternatives in the EIR, including the Concentration and Conservation alternatives, were not re-evaluated in the 2014 DEIS. As a result of the CEQA environmental review and planning process that eventually eliminated alternatives, none of the EIR alternatives were considered reasonable alternatives for reuse of the former NWS Concord in the DEIS. Please see FEIS Section 2.2.6, Alternatives Considered and Eliminated, for further information.

Water Quality
Mt. Diablo Creek, which bisects the site, is listed as impaired on the Clean Water Act Section 303(d) list due to the pesticide diazinon (sources: urban runoff/storm sewers) and toxicity from an unknown source (p. 3-210). The DEIS states that this impairment is being addressed by an EPA-approved Total Maximum Daily Load (TMDL), but does not discuss those efforts nor how the project would affect them. The project would add approximately 1,100 new acres of impervious surface, with development adjacent to Mt. Diablo Creek, and introduce new sources of urban runoff in the Mt. Diablo Creek watershed. The DEIS concludes that impacts to surface water quality would not be significant and that creek enhancements and channel restoration from the temporary impacts of development would result in beneficial impacts to water quality (p. 4-178).

> *Recommendation:* We recommend that the Final EIS describe existing restoration and enhancement efforts for Mt. Diablo Creek under the TMDL and how the proposed development would be coordinated with those efforts. Identify whether permeable pavement would be used and if this would reduce impacts to surface water quality, and discuss how urban pesticide runoff from new development would be prevented.

Hazards and Hazardous Substances
The DEIS provides a good summary of the areas of contamination and the cleanup actions being taken under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as Superfund. Since cleanup actions are ongoing, we recommend that the Final EIS include updates on the status of the cleanup actions at the CERCLA and Environmental Restoration Program sites.

In addition, we have the following recommendations for the Final EIS:

- For sites under review as part of the Preliminary Assessment Re-verification Investigation (PA/RVI), refrain from categorizing them in Tables 3.8-1 and 4.8-1 as "Closed or No Further Action". This is especially relevant for the Runway Apron Fuel Pit and Red Rock Disposal Area sites for which the Navy is recommending additional action.
- For sites with existing active remediation systems, particularly for groundwater and soil gas, that are likely to extend past land transfer, identify the associated institutional controls (ICs) in Table 4.8-1 instead of stating "not yet specified". IC's for these sites should, at a minimum, include not disturbing remediation equipment, and allowing access to equipment for maintenance, etc.
- Indicate at which sites contaminated groundwater is likely to be encountered during construction dewatering and describe any particular considerations necessary for proper management, treatment and disposal (p. 4-177)
- On page 4-78, the DEIS states that the City will require the developer to have a remediation plan that has been approved by applicable environmental regulatory agencies. Clarify the process for regulatory review of the remediation plan and what kinds of issues it would address, since the cleanup is likely to be complete for most sites once development would occur.

0011-10

0011-11

0011-12

0011-13

0011-14

0011-15

0011-10
Additional input regarding the Diazinon and Pesticide-Related Toxicity in Urban Creek TMDL and Mt. Diablo Creek was obtained from the Water Resources Engineer at the RWQCB; no restoration or enhancement activities on Mt. Diablo Creek associated with the TMDL are planned.

The EIS has been revised to indicate that the Mt. Diablo Creek 303(d) impairments are being addressed through an EPA-approved TMDL, the Diazinon and Pesticide-Related Toxicity in Urban Creeks TMDL. The current regulatory mechanism to implement this TMDL is the Municipal Regional Stormwater NPDES Permit, which includes the City of Concord, as part of the Contra Costa Clean Water Program. Provision C.9 (Pesticides Toxicity Control) requires permittees to implement a pesticide toxicity control program to address the use of pesticides that pose a threat to water quality and have potential to enter the municipal conveyance system. In addition to these requirements related to the Municipal Regional Stormwater NPDES Permit, any new development authorized by the City will include modern stormwater control and sewer systems that would reduce polluted urban runoff and storm sewer discharges into Mt. Diablo Creek, reducing any diazinon or replacement pesticide pollution originating from the site.

0011-11
The EIS was revised between the Draft and the Final to provide the current status (through December 2016) of each of the CERCLA Environmental Restoration (ER) Program sites remaining at NWS Concord.

0011-12
Recommendations from the Final Preliminary Assessment/Re-verification Investigation (PA/RVI) report, issued on June 30, 2016, have been incorporated into Sections 3.8 and 4.8, including Tables 3.8-1 and 4.8-1, of the FEIS.

In accordance with the comment, the PA/RVI sites have not been categorized as active or closed in Tables 3.8-1 and 4.8-1. Conclusions from the PA/RVI report regarding which sites have been recommended for no further action following the PA/RVI study have been included in the FEIS.

0011-13

Institutional Controls (ICs) have been developed for three sites: Solid Waste Management Units (SWMUs) 2, 5, 7, and 18 (one site), Installation Restoration (IR) Site 22, and IR Site 22A. Table 4.8-1 has been updated for the FEIS regarding anticipated ICs, where known.

0011-14
Four sites currently have ongoing groundwater investigation/cleanup activities: SMWUs 2, 5, 7 and 18 (one site); IR Site 29; IR Site 42; and Guam Way. In accordance with the City's Area Plan policies and the EIR mitigation measures adopted by the City pursuant to CEQA, any construction activities at or adjacent to these sites prior to site closure, including dewatering, if necessary, will be designed to ensure the existing groundwater plumes are not exacerbated by these activities. As explained in Section 4.8.2.1 and Table 7-1 of the EIS under Hazards and Hazardous Substances, the City's Area Plan policies and MMRP mitigation measures describe a City permitting process in which permit applicants (future property developers) will be required to 1) comply with applicable environmental laws and regulations, 2) develop and implement a Site Management Plan that addresses relevant topics such as construction dewatering, and 3) ensure "that development activities not interfere with any remediation activities or systems of the Navy or others."

0011-15
As clarified in the City of Concord's comment (referenced herein as comment 0024-5), the City of Concord will require a Remediation Plan only in the event of an Early Transfer. In that context, such a Remediation Plan would be prepared, reviewed, and approved in accordance with the law and regulations applying to Early Transfer. Section 4.8.2.1 of the EIS has been revised to incorporate this clarification.

Mitigation of Air Quality Impacts

The DEIS identifies significant air quality impacts for both the construction and operations phases of the project (pp. 4-33 – 4-34). For construction mitigation, it states only that all feasible construction activity control measures will be applied at the site. We were unable to find any specific references to these measures in the DEIS or the Concord Reuse Project Area Plan.

> *Recommendation:* We recommend that the FEIS identify the suite of mitigation measures that the City would deem feasible and require during construction. We recommend that the City include a requirement to utilize Tier 4 engines for project construction equipment to the maximum extent feasible.

For mitigation of operational emissions, the DEIS states that wood-burning fireplaces would be banned or required to employ best available control technologies, and that households with wood-burning fireplaces would comply with Spare the Air Day restrictions. While EPA Phase 2 Qualified fireplaces are approximately 70% cleaner than unqualified models[2], they still represent a substantial new pollutant source when applied to 12,272 new housing units. We note that, in addition to the health effects caused by particulate matter pollution, wood smoke contains black carbon, a greenhouse gas[3].

> *Recommendation:* We recommend that the City prohibit the installation of wood-burning fireplaces for the project. If wood-burning fireplaces are not prohibited in the project development, we recommend that the FEIS provide estimates of greenhouse gases and black carbon emissions that would result from the operational phase of the project. Since it is difficult to predict compliance with Spare the Air Day restrictions, we recommend eliminating that as a mitigation measure.

[2] http://epa.gov/burnwise/fireplaces.html
[3] http://epa.gov/blackcarbon/

0011-16

0011-16

0011-17

0011-16
The suite of mitigation measures requested by the commenter was previously provided in the City's FEIR under Mitigation Measure AQ-5, which indicates that the following controls will be implemented at all construction sites in order to reduce emissions from construction activities. Basic control measures: 1. Water all active construction areas at least twice daily. Cover all trucks hauling soil, sand, and other loose materials or require all trucks to maintain at least 2 feet of freeboard. 2. Pave, apply water three times daily, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas, and staging areas at construction sites. 3. Sweep daily (with water sweepers) all paved access roads, parking areas, and staging areas at construction sites. Sweep streets daily (with water sweepers) if visible soil material is carried onto adjacent public streets.

The following enhanced control measures will be implemented at construction sites greater than 4 acres in area: 1. All "Basic" control measures listed above. 2. Hydroseed or apply (non-toxic) soil stabilizers to inactive construction areas (previously graded areas inactive for 10 days or more). 3. Enclose, cover, water twice daily, or apply (non-toxic) soil binders to exposed stockpiles (dirt, sand, etc.). 4. Limit traffic speeds on unpaved roads to 15 miles per hour. 5. Install sandbags or other erosion-control measures to prevent silt runoff to public roadways. 6. Replant vegetation in disturbed areas as quickly as possible.

The following control measures are required at construction sites that are large in area, located near sensitive receptors, or which for any other reason may warrant additional emissions reductions: 1. Install wheel washers for all exiting trucks, or wash off the tires or tracks of all trucks and equipment leaving the site. 2. Install wind breaks or plant trees/vegetative wind breaks at windward side(s) of construction areas. 3. Suspend excavation and grading activity when winds (instantaneous gusts) exceed 25 miles per hour. 4. Limit the area subject to excavation, grading, and other construction activity at any one time.

All construction equipment will require the following control measures: 1. Comply with the latest CARB certification for off-road heavy duty diesel engines. 2. Maintain properly tuned engines. 3. Minimize the idling time of diesel-powered construction equipment to two minutes. 4. Use alternative powered construction equipment (i.e., compressed natural gas, biodiesel, electric) whenever possible. 5. Use add-on control devices such as diesel oxidation catalysts or particulate filters, as appropriate. 6. Limit the operating hours of heavy duty equipment.

In addition to emission-control strategies described in the FEIR under Mitigation Measure AQ-5, the City will require Tier 4 engines for construction equipment to the maximum extent feasible, as suggested by the commenter.

No revisions have been made to the EIS in response to this comment.

0011-17
With respect to operational emissions, the DEIS air quality analysis has determined that most air quality impacts described in the City's FEIR will be mitigated through implementation of the measures defined in the FEIR and Climate Action Plan. As noted in Mitigation Measure AQ-1, wood-burning fireplaces may be banned within the CNWS or required to employ best available control technologies, in addition to the required compliance with all applicable Spare the Air Day restrictions. The DEIS assumed that wood-burning fireplaces would be banned; the analysis included other specific air quality mitigation measures for buildings and transportation that would mitigate overall project emissions. Although the project may allow some controlled fireplaces, it is not feasible at this time to determine the number of fireplaces that will be allowed or the control measures that would be implemented. The additional emissions from controlled wood-burning fireplaces in some households would be difficult to quantify at this time but are not expected to change the conclusions of the DEIS.

No revisions have been made to the EIS to address this comment.

Subject: Concord Naval Weapons Station Re-use Proposals

I am a long time Concord resident sinca 1971. I STRONGLY believe that the best plan for the former NWS property is to NOT develop it. It should be cleaned up and left as open undeveloped space, NOT crammed full of low end housing as this city sees fit to do with every possible scrap remaining open land. I lost the open space behind my home a few years ago when 24 units of cheap housing was squeezed into a former railway right of way. There wasn't even enough space to build a proper street, so they built a little alley way called "Silverleaf Lane" to access the homes. They have no street parking, as there's no actual street. I sadly had to witness thousands of california quail in a mass migration through our backyards to I don't know where when the heavy equipment arrived. we ALL lost our herd of tule elk some yeard ago Heavy dense unchecked growth is NOT in Concord's best interest.

The proposed developement will only increase stress on an already over burdened infastructure. Our streets are in serious need of repair. Shopping centers are neglected and many stores are vacant. Our city leaders appear to be using Oakland's squallor and poverty as the model for Concord's future. I know what I'm saying, I have also been an Oakland resident since 1978. This is not what we want for our city. The parking for the proposed "villages" is completely inadequate. BART riders will be parking in those neighborhoods, as there isn't enough parking at BART. There isn't adequate bus service so that people must drive to get to the trains. I sincerely believe ANY development of the base is ill conceived and I do not support it. Our wildlife deserve to keep their existing habitat which the base has offered for a long time. Thank you.

Silva Harr
[redacted]

0013-1
As noted in the EIS, the purpose of the proposed action is to dispose of surplus property at the former NWS Concord for subsequent reuse in a manner consistent with the policies adopted by the City of Concord. The need for the proposed action is to provide the local community the opportunity for economic development and job creation.

0013-1 Alternative 1 (the Preferred Alternative) is reuse of the surplus property consistent with the City of Concord's Area Plan, as adopted. As discussed in Chapter 1, the Area Plan upon which Alternative 1 is based was the result of an extensive reuse planning process that took place between 2008 and 2012 undertaken by the City of Concord, during which seven alternatives were evaluated. All seven of the alternatives were variations on mixed-use development. In accordance with NEPA, the Navy is also evaluating an alternative to the proposed action, Alternative 2 (Intensified Reuse), which is also consistent with the policies developed by the City of Concord during the reuse planning process but represents a higher intensity of use overall.

Please see the EIS for a discussion of socioeconomics, wildlife/natural resources, and traffic and transportation (Sections 4.3, 4.5, and 4.11, respectively).

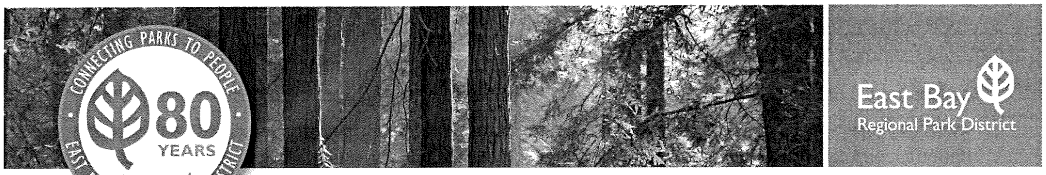
Re: East Bay Regional Park District Comments on Navy Draft EIS for the Disposal and Reuse of the Former Naval Weapons Station Seal Beach, Detachment Concord

Dear Ms. Spinelli:



Thank you for the opportunity to provide comments on the draft Environmental Impact Statement (EIS) for the disposal and reuse of the Naval Weapons Station Detachment, Concord, California.

The East Bay Regional Park District (District) is the nation's largest regional park district managing 65 regional parks, recreation areas, wilderness, shorelines, and preserves encompassing over 114,000 acres within Alameda and Contra Costa County. The District manages 29 regional trails connecting East Bay cities to over 1,200 miles of natural surface trails within parklands. Additionally, the District offers 235 family campsites, 42 youth camping areas, numerous picnic grounds, and 10 interpretive and education centers. The District had a budget of over $228 million in 2014 with an equivalent of 739 full time employees.

The District has had a long-term interest in establishing a new regional park on the lands of the former Concord Naval Weapons Station (CNWS). The District's Master Plan identifies the Concord Hills Regional Park on the CNWS lands consistent with the Area Plan adopted by the City of Concord Local Reuse Authority.

In November, 2008, voters in Alameda and Contra Costa County approved Measure WW, the Regional Open Space, Wildlife, Shoreline, and Parks Bond Extension. The CNWS was identified as a major priority in Measure WW with $16 million allocated to work in partnership with Concord and the National Park Service to acquire, restore, and develop a major new regional park that would protect open space and wildlife habitat while developing a range of recreation, interpretive, and education facilities in the area.

On October 28, 2009, President Obama approved H.R. 2647, the National Defense Authorization Act for Fiscal Year 2010, that contained provisions for the Port Chicago Naval Magazine National Memorial to be administered as a unit by the National Park Service (NPS).

2950 PERALTA OAKS COURT • P.O. BOX 5381 • OAKLAND • CA • 94605-0381
T. 1 888 EBPARKS F. 510 569 4319 TDD. 510 633 0460 WWW.EBPARKS.ORG

The Port Chicago Naval Magazine National Memorial is located within the active tidal area of Military Ocean Terminal Concord (MOTCO) operated by the U.S. Army and public access remains restricted. The authorizing legislation authorized NPS to work in partnership with the City of Concord and the District to establish and operate a facility for visitor orientation and parking, administrative offices, and curatorial storage for the National Memorial. The District has been working with NPS in planning for such a facility on the closed inland area of the former CNWS.

The City of Concord, acting as the Local Reuse Authority, initiated a multi-year community planning process following closure of the CNWS in 2008 culminating in the adoption of a Reuse Plan in 2010. This plan was further refined and integrated into Concord's General Plan through the adoption of the Concord Reuse Project Area Plan in January 2012.

The adopted Area Plan includes the new regional park of 2,540 acres located on the eastern portion of the site to be conveyed to the District through a public benefit conveyance. The Area Plan designates the Regional Park area as "Conservation Open Space" and describes the area as including hiking trails and trailheads, bicycle paths, picnic areas, overlooks, and an interpretive center, and other recreation and education facilities as appropriate with the area's conservation goals. The Area Plan explains that the regional park "will add to the region's rich network of publicly accessible parkland while maintaining and enhancing the site's habitat value." (Concord Reuse Project Area Plan, p. 68, Section 3.4A.)

The District Board of Directors authorized submittal of an application for a public benefit conveyance (PBC) through the National Park Service Federal Lands to Parks program on September 3rd, 2013. On May 8, 2014, NPS informed the District and the Navy that the PBC application for 2,540 acres of the former CNWS was approved and that they will grant a public benefit allowance of 100 percent of the fair market value of the property to be conveyed.

The District envisions a world class regional park that balances public access and recreation with natural and cultural resource protection. Conceptual plans have developed incorporating information and community input received during the development of the Reuse Plan and Area Plan, as well as the City's Trails Master Plan and the aforementioned enabling legislation for the Port Chicago Naval Magazine National Memorial.

The District is initiating a Land Use Plan that will guide implementation of the Concord Hills Regional Park. The Land Use Plan will identify recreational and educational facilities, trails, and operational support facilities that will be developed in coordination with the City of Concord consistent with the habitat preservation requirements identified in the Area Plan and to be further developed through consultation with state and federal resource agencies.

2950 PERALTA OAKS COURT • P.O. BOX 5381 • OAKLAND • CA • 94605-0381
T. 1 888 EBPARKS F. 510 569 4319 TDD. 510 633 0460 WWW.EBPARKS.ORG

Specific Comments on the Draft EIS

Executive Summary:

There is only one sentence in the Executive Summary that mentions the District's role in the proposed action, and that language does not appear until page ES-5. The language provides: "The land within [the Conservation Open Space District] is anticipated to be designated for open space and regional park uses and would be managed by the East Bay Regional Park District (EBRPD)." Please add the following language regarding the District on page ES-1:

> The District submitted an application for a public benefit conveyance (PBC) through the National Park Service Federal Lands to Parks program on September 3, 2013. On May 8, 2014, the National Park Service informed the District and the Navy that the PBC application for 2,540 acres of the former Concord Naval Weapons Station was approved.

Chapter 1:

On page 1-2 of the EIS, the statement of Purpose and Need for the proposed action recognizes the need to provide the local community with "the opportunity for economic development and job creation," but does not state any purpose or need related to the proposed regional park on the PBC portion of the property. This paragraph should be revised to state the additional purpose and need of providing a large regional park and open space for the local community.

Chapter 2:

The description of "Conservation Open Space" on page 2-12 of the EIS is incomplete. The District requests that the Navy insert the following suggested language, which is consistent with the Area Plan and with the District's 2013 Public Benefit Conveyance Application approved by NPS in 2014:

> The Conservation Open Space District consists of a large regional open space occupying approximately 2,537 acres, which would be located on the eastern portion of the former NWS Concord. The land within the district is anticipated to be designated for open space and regional park uses and would be managed by the East Bay Regional Park District (EBRPD). The EBRPD will be developing a Land Use Plan that will identify future land uses within the Conservation Open Space area in a manner that balances public access and recreational and educational facility development with natural and cultural resource conservation. This Regional Park would include conversion of rails to trails, development of new regional trail connections, development of a jointly managed visitor center for the Port Chicago Naval Magazine National Memorial, and passive recreational and environmental education facilities including picnic areas, interpretive displays, and other limited intensity uses consistent with resource protection goals. Access, infrastructure, and parking will be accommodated within existing developed areas to the maximum extent feasible, to be evaluated through the development of a Land Use Plan.

0014-1

0014-2

0014-3

0014-1
Comment noted. Information on the public benefit conveyances has instead been added to a new FEIS Section, Section 2.2.3.4 Property Conveyances. This section briefly describes the Navy's transfer process and includes information on the types of conveyance mechanisms to be used for the former NWS Concord, with discussion of the associated sponsoring agencies for the public benefit conveyances. An abbreviated summary of this discussion has also been included under ES.4.1 Alternative 1.

0014-2
The purpose and need of the proposed action is related solely to the BRAC action. The proposed action is disposal and reuse of the former NWS Concord in accordance with the City's Area Plan, which includes reuse of the former NWS Concord for conservation/open space. In addition, as stated in Section 1.2, the Navy's disposal of the surplus former NWS Concord property into non-federal ownership and the subsequent reuse of the property following disposal by the Navy is the focus of the EIS.

0014-3
Comment noted. As mentioned in FEIS Section 1.10, additional detail is not included in the EIS regarding the specific components of the Concord Hills Regional Park Land Use Plan, because the Area Plan has not been amended, and the process established by the City of Concord for implementation of the Area Plan has not changed. The proposed action evaluated in this EIS remains reuse of the property in a manner consistent with the City of Concord's Area Plan.

2950 PERALTA OAKS COURT • P.O. BOX 5381 • OAKLAND • CA • 94605-0381
T. 1 888 EBPARKS F. 510 569 4319 TDD. 510 633 0460 WWW.EBPARKS.ORG

On page 2-13 of the EIS, the second full paragraph describes the PBC conveyance to the District as uncertain. This language should be revised to reflect that NPS approved the District's PBC application on May 8, 2014.

> Some facilities ~~may~~ will be developed and operated by agencies other than the City of Concord, such as the Contra Costa County Sheriff, MDUSD, and the EBRPD. Some sites may be transferred through public benefit conveyances. Uses that have been introduced through the public benefit conveyance (PBC) request process and that may be developed on the site include a sheriff's, fire department, and firstresponder training center, and large, open-space areas for habitat protection, regional park, restoration, and recreational opportunities. On May 8, 2014, the National Park Service informed the District and the Navy that it approved the EBRPD's PBC application for 2,540 acres of the former Concord Naval Weapons Station for development of a regional park. ~~Should the proposed conservation open space area be conveyed to the EBRPD for regional park uses, f~~ Future planning and design efforts for the regional park will ~~would~~ be completed in accordance with the EBRPD Master Plan and could include conversion of rails to trails, development of new regional trail connections, development of a visitor center developed collaboratively with the National Park Service, and passive recreational and environmental education facilities including picnic areas, interpretive displays, and other limited intensity uses consistent with resource protection goals. ~~an interpretive center within the proposed regional park developed collaboratively with the U.S. National Park Service.~~

Chapter 3: Section 3.2 Land Use and Zoning

On page 3-11, Section 3.2.4.1, the EIS enumerates some of EBRPD's policies that are applicable to the development of regional parks. The District requests that EIS be revised to include the additional EBRPD policies enumerated in **Attachment A** to this letter.

Chapter 3: Section 3.8 Hazards and Hazardous Substances

As provided on page 3-97, the EIS provides that the Navy contemplates leaving certain residual contamination (for example, residual pesticide contamination, TCE contained in soil vapor near buildings, PCB-containing oils contained in electrical equipment) on the CNWS property. The District's view is that this residual contamination should be remediated prior to transfer of the Property. Thus, the District requests that the Navy add the following language to page 3-97 to acknowledge the limitations of the Navy's ER Program:

> Certain residual contamination (for example, residual pesticide contamination, TCE contained in soil vapor near buildings, PCB-containing oils contained in electrical equipment) may remain at the former CNWS property. To the extent that it is not remediated pre-transfer, that contamination may remain at the NWS Concord property for extended periods of time, particularly on the PBC parcel, before such contamination is addressed in connection with development of the PBC.

On page 3-100, at the end of Section 3.8.2.1, the District requests that the Navy add the same language suggested above for page 3-97.

0014-3 Continued

0014-3 cont'd
Additionally, the requested revision was not incorporated as requested because information on the public benefit conveyances has now been moved to a new subsection of the FEIS, Section 2.2.3.4 Property Conveyances, which briefly describes the Navy's transfer process, and includes information on the types of conveyance mechanisms to be used for the former NWS Concord, with discussion of the associated sponsoring agencies for the public benefit conveyances. An abbreviated summary of this discussion has also been included under ES.4.1 Alternative 1. The RTC requesting that the Navy include this information in the EIS has also been revised.

0014-4

0014-4
Section 3.2.4.1 of the FEIS has been revised to include the suggested language.

0014-5

0014-5
As explained in Section 3.8.2.3., the Navy is required to prepare a Finding of Suitability to Transfer (FOST) or Finding of Suitability for Early Transfer (FOSET) prior to property transfer.

A FOST provides a summary of the environmental conditions and notifications for hazardous substances. The notifications as well as restrictions of certain activities are intended to ensure that post-transfer use of the FOST Parcel is consistent with protection of human health and the environment. These notices and restrictions in a FOST will address sites with institutional controls, asbestos-containing material, lead-based paint, polychlorinated biphenyl (PCB)-containing equipment, pesticides, petroleum, and munitions and explosives of concern.

Deed notices and restrictions are intended to provide the future property owner with information regarding the environmental conditions at the time of transfer.

No changes are required to Section 3.8.2.1 .

0014-6

0014-6
Please see Response to Comment 14-5.

2950 PERALTA OAKS COURT • P.O. BOX 5381 • OAKLAND • CA • 94605-0381
T. 1 888 EBPARKS F. 510 569 4319 TDD. 510 633 0460 WWW.EBPARKS.ORG

On page 3-100, in the first sentence of Section 3.8.2.2, no evidence is provided for the statement that the Navy "has complied with other regulations" as stated. The District requests that the Navy provide the following substitute language:

> In addition to the requirements of the ER Program, the Navy is subject to other regulations for hazardous wastes and materials during ownership and occupancy of the former NWS Concord property.

On page 3-102, in the first paragraph of Section 3.8.2.3, the current text implies that all contamination will be remediated prior to transfer. The District requests that the Navy add the following sentence at the end of the first paragraph to clarify this point:

> Prior to conveyance, not all hazardous materials will be addressed or cleaned up to standards consistent with reasonably anticipated future land uses, particularly on the PBC.

On page 3-123, in Section 3.8.3.3.1, the discussion of Building 93 indicates that TCE was detected in groundwater, but does not address soil vapor and vapor intrusion issues. The District requests that the Navy add the following sentence at the end of that paragraph:

> Soil vapor samples for TCE were not collected to determine whether TCE may pose vapor intrusion issues at Building 93.

On page 3-134, in Section 3.8.6.6, the discussion indicates that transformer oils containing PCBs at levels greater than 5 mg/L will be left in the equipment. This section also indicates that light ballasts manufactured before 1979 likely contain PCBs. The District requests that the Navy add the following text to that section:

> Oils containing PCBs above the California threshold for categorization as a hazardous waste (5 mg/L) may remain in electrical equipment for extended periods of time, particularly on the PBC property, before that property can be redeveloped. In addition, PCB-containing light ballasts may remain in buildings for an extended period of time, particularly on the PBC property, before redevelopment takes place.

Chapter 4: Section 4.5 Biological Resources

The Biological Resources impact analysis contains internal inconsistencies with regard to the assumptions governing the level of development and proposed uses of the PBC parcel that will be developed into a regional park. The District requests that the Navy provide introductory language in Section 4.5 explaining the extent of disturbance and development on the Conservation/Open Space parcel, in particular, that the regional park will include conversion of rails to trails, development of new regional trail connections, development of a visitor center developed collaboratively with NPS, and passive recreational and environmental education

0014-7

0014-7
The intent of the first sentence of Section 3.8.2.2 is to indicate that the Navy has complied with regulations for hazardous wastes, USTs, ASTs, and other associated plans and codes while under Navy ownership.

A FOST or FOSET to be issued prior to transfer will provide additional information about site and media-specific compliance.

No changes are required to Section 3.8.2.2.

0014-8

0014-8
As stated, FOSTs summarize how the requirements and notifications for hazardous substances, petroleum products, and other regulated materials have been satisfied. A FOST provides a summary of current environmental conditions, and any restrictions, notifications, or deed covenants related to hazardous materials that may remain at transfer.

No changes are required to Section 3.8.2.3.

0014-9

0014-9
Building 93 (SWMU 24) has been investigated several times since 1997 including a RCRA Facility Assessment (RFA), geophysical investigation, explosive hazard investigation, and an Area of Potential Interest (AOPI) Site Inspection (SI). No further action (NFA) was recommended for Building 93 in 2013 based on the results of an AOPI SI and previous investigations. The Department of Toxic Substances Control (DTSC) provided a concurrence letter on November 4, 2015. No additional investigation is warranted.

0014-10

No changes are required to the discussion of Building 93 in Section 3.8.3.3.1.

0014-11

0014-10
Section 3.8.6.6 has been updated to include results from a recent base-wide PCB inventory and inspection that was conducted between 2013 and 2015 in preparation for property transfer of the former NWS Concord. Of the 207 pieces of oil-filled electrical equipment remaining at the installation, all contain either no PCBs or PCBs below the EPA limit (50 ppm). Some of those pieces may contain PCBs above 5 ppm, which is the level at which the California DTSC requires PCB-containing liquids to be

managed as a hazardous waste (22 CCR Division 4, Chapter 11, Article 3), when those liquids are disposed of.

Section 3.8.6.6 has been updated to further clarify that light ballasts that do not have a "Contains no PCBs" label, were manufactured prior to 1979, and for which the manufacturer cannot confirm the PCB content could be considered to potentially contain PCBs. Section 4.8.2.4.6 has been updated to clarify that old fluorescent light fixtures that are removed by future owners of the property could contain PCB-containing ballasts that would require disposal as a hazardous waste if the PCB content could exceed DTSC hazardous waste standards.

The FOST will contain a summary of current environmental conditions, and any restrictions, notifications, or deed covenants related to hazardous materials that may remain at transfer. The transferee assumes responsibility at time of transfer and shall comply with existing federal, state, and local laws and regulations independent of the time when construction/demolition activities are conducted.

0014-11
The impact analyses provided in the DEIS were based on the conceptual plans for the conservation/open space parcel that were available at the time of DEIS publication and are considered adequate for a NEPA-level analysis. Since development of the Draft EIS, additional details are available on the conversion of rails to trails, development of new regional trail connections, development of a visitors center and other limited uses. The FEIS has been updated where appropriate and relevant to reflect the information available at the time of FEIS publication.

2950 PERALTA OAKS COURT • P.O. BOX 5381 • OAKLAND • CA • 94605-0381
T. 1 888 EBPARKS F. 510 569 4319 TDD. 510 633 0460 WWW.EBPARKS.ORG

facilities including picnic areas, interpretive displays, and other limited intensity uses consistent with resource protection goals.

On page 4-47, the second paragraph states that only five percent of the Conservation Open Space district would be disturbed during construction. The District requests that this paragraph be revised as follows:

> Reuse of the former NWS Concord would disturb up to 2,540 acres of land, based on the assumption that 5 percent of the Conservation Open Space development district would be disturbed during construction, and all land within the other development districts would be disturbed during construction. However, acreage of disturbance from construction on the Conservation Open Space development district is unknown and may be greater than five percent. The actual extent of disturbance will be evaluated in EBRPD's Land Use Plan and associated environmental review documents. Construction activities would result in disturbance of soils, erosion, and other impacts.

On page 4-52, the EIS concludes that the loss of 353 acres of ruderal habitat (75%) is less than significant but provides no support for this conclusion. The District suggests that the following language be added to the impact discussion regarding ruderal habitat. A similar revision is suggested for the impact discussion regarding orchards and plantations, found at pages 4-52 and 4-53 of the EIS.

> **Ruderal/Urban**
> Under Alternative 1, the majority of the ruderal habitat type, 353 acres (76 percent), would be permanently removed. Ruderal habitat would be removed from within all the development districts, with the majority being removed within the Village Neighborhood and First Responder Training Center development districts. Approximately 467 acres (9 percent of the site) are developed with urban and industrial areas, including roadways, parking lots, runways, railroad yards, and asphalt aprons surrounding buildings. Such areas often contain patches of ruderal vegetation as well as landscaped trees and shrubs. Ruderal vegetation also exists on the roofs of bunkers, which are covered with soil and provide some grassland habitat. As much of the ruderal habitat is within existing developed areas and the associated maintained landscaped vegetation communities on the former NWS Concord, the loss of 353 acres of ruderal habitat would not be significant because future project proponents would be required to avoid, minimize, and/or compensate for impacts to ruderal habitat.

On page 4-53, the EIS states that all fencing will be removed. This statement is not accurate, as some fencing will need to remain on site. The District requests that this statement be revised as follows:

> Under Alternative 1, in consultation with U.S. Fish & Wildlife Service, where necessary this fencing would be removed from the former NWS Concord, ~~thus alleviating~~ to alleviate these constraints to wildlife movement into the future conservation area.

0014-12

0014-12
Comment noted. Section 4.5.5.1 has not been revised to incorporate the requested change because the Area Plan has not been amended, and the process established by the City of Concord for implementation of the Area Plan has not changed. The proposed action evaluated in this EIS remains reuse of the property in a manner consistent with the City of Concord's Area Plan. However, as stated in Chapter 1.10 of the FEIS, Sections 2, 3, and 4 of the FEIS have been revised to recognize that the EBRPD has begun development of the Concord Hills Regional Park Land Use Plan, and relevant conservation measures from the BO have been incorporated into the proposed action. Also as noted in the FEIS, the EBRPD will be responsible for completing environmental review of Concord Hills Regional Park Land Use Plan as required under CEQA, and any implementation of the Land Use Plan involving construction projects will require further review and permitting from a variety of agencies.

0014-13

0014-13
Section 4.5.1.1 has been revised to better clarify that the loss of ruderal habitat and orchards and plantations are not significant. Statements regarding avoidance and mitigation were not included as there are no statutory requirements applicable to protection of ruderal habitats, plantations, or orchards. In addition, these habitats are not particularly valuable to wildlife because ruderal habitats are frequently dominated by hardscape and other developed features, and the ruderal habitats, plantations, and orchards on the installation are dominated by non-native vegetation.

0014-14

0014-14
The commenter is correct that not all of the existing fencing will be removed and that some fencing will need to remain on the site. Some fencing may need to remain in place for safety reasons or in association with cattle-grazing. Some, but not all portions of the existing fence, would be removed in association with the development of conservation measures to benefit listed species based on consultations with the U.S. Fish and Wildlife Service and the California Department of Fish and Game.

Sections 4.5.1.2 and 4.5.2.2 of the FEIS have been modified to more accurately describe wildlife movement and the approach to removal of fencing.

2950 PERALTA OAKS COURT • P.O. BOX 5381 • OAKLAND • CA • 94605-0381
T. 1 888 EBPARKS F. 510 569 4319 TDD. 510 633 0460 WWW.EBPARKS.ORG

Chapter 4: Section 4.8 Hazards and Hazardous Substances

On page 4-76, Section 4.8.1.1 states that the future developer will complete the remediation at NWS Concord and that there will be no reasonably foreseeable impacts after completion of the Navy's portion of the cleanup. The District requests that the Navy add the following text to this section:

> Residual pesticides in soil, TCE in soil vapor, ACM in buildings and transformer oil containing PCBs at levels above the California threshold for categorization as a hazardous waste (5 mg/L) may remain in place at the property, particularly the PBC property, for an extended period of time before redevelopment takes place.

On page 4-77, Section 4.8.2.1 describes the ER Program. The District requests that the Navy consider adding the same language suggested for Page 3-97 at the end of Section 4.8.2.1 (pasted again below).

> Certain residual contamination (for example, residual pesticide contamination, TCE contained in soil vapor near buildings, PCB-containing oils contained in electrical equipment) may remain at the former CNWS property. To the extent that it is not remediated pre-transfer, that contamination may remain at the NWS Concord property for extended periods of time, particularly on the PBC parcel, before such contamination is addressed in connection with development of the PBC.

On page 4-78, Section 4.8.2.1 states that the City of Concord will require a developer to have an approved remediation plan in place. The District requests that the Navy add the following language near the end of that section concerning impacts of remediation on the PBC parcel:

> Depending on the scope and extent of additional remediation necessary on the PBC parcel, the implementation of such further remediation may prevent or delay for extended periods of time the redevelopment of portions of the PBC.

On page 4-81of the EIS, Table 4.8-1 lists the status for various ER Program sites. In light of the new guidance regarding TCE from Region 9 of the U.S. Environmental Protection Agency, the District requests that all locations on the PBC parcel be further investigated for TCE contamination, including for vapor intrusion. In particular, Building 81, Building 93 and buildings located at SWMUs 12, 20, 23, 24, 25, 29 and 54 should be investigated for vapor intrusion risks.

On page 4-81 of the EIS, Table 4.8-1 lists the status for various UXO-impacted sites. The District requests that surface soils at UXO sites IRP Site 24A, UXO 0010, UXO 0012, UXO 0013 be sampled by the Navy for chemicals of concern, using Method 8330B and other appropriate analytical methods.

0014-15

The 2nd to last paragraph of Section 4.8.1.1 is intended to document that the Navy is responsible under CERCLA to complete the remedial action and the future property owner is responsible for adhering to the local, state, and federal regulations for redevelopment activities.

No changes are required to Section 4.8.1.1.

0014-15

0014-16

Please see response to Comment 14-5. As well, Section 4.8.2.1 refers to the impact assessment methodology in Section 4.8.1.1, which has been updated to refer to the FOST/FOSET that the Navy will prepare.

0014-16

0014-17

As discussed in the response to Comment 11-14, Section 4.8.2.1. has been updated to clarify that the City will require a Remediation Plan only in the event of an Early Transfer.

0014-17

0014-18

The Navy is currently conducting a soil vapor and groundwater investigation at IR Site 42 (Building 81) and a Site Investigation at IR Site 41 (1A-100). Building 93 and SWMU sites within the EBRPD Public Benefit Conveyance (PBC) property have obtained NFA by the regulatory agencies. No further evaluation is required at these sites.

0014-18

0014-19

The Navy is currently conducting CERCLA investigations at UXO 1A (IR Site 24A, Pistol Firing Range), UXO 10 (Eagle's Nest EOD), UXO 12 (Bermed Area), and UXO 13 (Rocket Practice Area). The fieldwork is being conducted under the oversight of the environmental regulatory agencies under regulator-approved work plans. In accordance with the CERCLA process, chemicals of concern are based on results of previous investigations conducted at each site. The Navy has used EPA Method 8330B at some sites as appropriate. Based upon site-specific conditions, it is not always preferred.

0014-19

2950 PERALTA OAKS COURT • P.O. BOX 5381 • OAKLAND • CA • 94605-0381
T. 1 888 EBPARKS F. 510 569 4319 TDD. 510 633 0460 WWW.EBPARKS.ORG

On page 4-95, Section 4.8.2.4.4 discusses asbestos and states that future developers will remediate the asbestos. The circumstances governing both development of the EDC Parcel, and funding for asbestos removal on the EDC parcel, differ markedly from those on the PBC parcel. For this reason, the District requests that the Navy add the following sentence to this section:

> At the PBC, where redevelopment of the various buildings may not occur in the near future, ACM not removed by the Navy may remain in place for extended periods of time.

On page 4-96, Section 4.8.2.4.5 discusses lead-based paint and states that future developers will remediate the lead-based paint. As provided above, the circumstances governing both development of the EDC Parcel, and funding for removal of lead-based paint on the EDC parcel, differ markedly from those on the PBC parcel. For this reason, the District requests that the Navy add the following sentence to this section:

> At the PBC, where redevelopment of the various buildings may not occur in the near future, LBP not removed by the Navy may remain in place for extended periods of time.

On page 4-97, Section 4.8.3.1 states that the City of Concord would ensure that future redevelopment activities were compatible with prior remediation activities of the Navy. The District requests that the Navy add the same language suggested for Page 3-97 to Section 4.8.3.1 (pasted again below).

> Certain residual contamination (for example, residual pesticide contamination, TCE contained in soil vapor near buildings, PCB-containing oils contained in electrical equipment) may remain at the former CNWS property. To the extent that it is not remediated pre-transfer, that contamination may remain at the NWS Concord property for extended periods of time, particularly on the PBC parcel, before such contamination is addressed in connection with development of the PBC.

Chapter 4: Section 4.10 Public Services

On pages 4-115, the District requests that the Navy revise the last paragraph, as provided below, to provide a more accurate assessment of how EBRPD's police services will be funded.

> Similarly, EBRPD police services are primarily funded by property tax revenue (EBRPD 2013a, 2014d), and increases in service costs would be partially offset by increased tax revenues.

0014-20

Sections 3.8.6.4 and 4.8.2.4.4 have been updated to reflect the completion of the final basewide asbestos study, which describes the conditions at each of the structures surveyed.

As described in Section 4.8.2.4.4, the transferee assumes responsibility for management of asbestos at the time of transfer and shall comply with existing federal, state, and local laws and regulations independent of the time when construction/demolition activities are conducted.

0014-21

As described in Section 4.8.2.4.5, the transferee assumes responsibility for management of lead-based paint at the time of transfer and shall comply with existing federal, state, and local laws and regulations independent of the time when construction/demolition activities are conducted.

No changes are required to text in Section 4.8.2.4.5.

0014-22

Also please see responses to Comments 14-5 and 14-16. As explained in Section 3.8.2.3, the Navy is required to prepare a FOST (or a FOSET, for Early Transfer) prior to property transfer.

A FOST provides a summary of the environmental conditions and notifications for hazardous substances. The notifications as well as restrictions of certain activities are intended to ensure that post-transfer use of the FOST Parcel is consistent with protection of human health and the environment. These notices and restrictions in the FOST address sites with institutional controls, asbestos-containing material, lead-based paint, PCB-containing equipment, pesticides, petroleum, and munitions and explosives of concern.

Deed notices and restrictions are intended to provide the future property owner with information regarding the environmental conditions at the time of transfer.

The transferee assumes responsibility for management at the time of transfer and shall comply with existing federal, state, and local laws and regulations independent of the time when construction/demolition activities are conducted.

No changes are required to Section 4.8.3.1.

0014-23
Section 4.10 of the FEIS has been revised as suggested.

East Bay Regional Park District

2950 PERALTA OAKS COURT • P.O. BOX 5381 • OAKLAND • CA • 94605-0381
T. 1 888 EBPARKS F. 510 569 4319 TDD. 510 633 0460 WWW.EBPARKS.ORG

Thank you again for the opportunity to comment on draft EIS. We look forward to continuing to work with the Navy, the City of Concord, and other stakeholders to create a world class regional park on the former CNWS. Please feel free to contact me at (510) 544-2623 or bholt@ebparks.org should you have any questions.

Michael Wright, Reuse Project Director (City of Concord)

Enclosure

ATTACHMENT "A"
EBRPD POLICIES APPLICABLE TO DEVELOPMENT OF REGIONAL PARKS

1. NATURAL RESOURCE MANAGEMENT (NRM)

NRM1: The District will maintain, manage, conserve, enhance, and restore park wildland resources to protect essential plant and animal habitat within viable, sustainable ecosystems.

NRM1b: To help mitigate the effects of climate change, the District will endeavor to conserve and connect habitat for native species through its acquisition and planning processes.

NRM2: Plant and animal pest species will be controlled by using integrated pest management (IPM) procedures and practices adopted by the Board of Directors. The District will employ integrated pest management practices to minimize the impact of undesirable species on natural resources and to reduce pest-related health and safety risks to the public within developed facilities and/or high-use recreational areas.

NRM3: The District will manage park wildlands using modern resource management practices based on scientific principles supported by available research. New scientific information will be incorporated into the planning and implementation of District wildland management programs as it becomes available. The District will coordinate with other agencies and organizations in a concerted effort to inventory, evaluate, and manage natural resources and to maintain and enhance the biodiversity of the region.

NRM4: The District will identify, evaluate, conserve, enhance, and restore rare, threatened, endangered, or locally important species of plants and animals and their habitats, using scientific research, field experience, and other proven methodologies. Populations of listed species will be monitored through periodic observations of their condition, size, habitat, reproduction, and distribution. Conservation of rare, threatened, and endangered species of plants and animals and their supporting habitats will take precedence over other activities, if the District determines that the other uses and activities would have a significant adverse effect on these natural resources.

NRM5: The District will maintain and manage vegetation to conserve, enhance, and restore natural plant communities; to preserve and protect populations of rare, threatened, endangered, and sensitive plant species and their habitats; and, where possible, to protect biodiversity and to achieve a high representation of native plants and animals.

NRM8: The District will conserve, enhance and restore biological resources to promote naturally functioning ecosystems. Conservation efforts may involve using managed grazing in accordance with the District's Wildland Management Policies and Guidelines, prescribed burning, mechanical treatments, integrated pest management and/or habitat protection and restoration. Restoration activities may involve the removal of invasive plants and animals or the reintroduction of native or naturalized species adapted to or representative of a given site.

NRM12: The District will manage riparian and other wetland environments and their buffer zones to preserve and enhance the natural and beneficial values of these important resources and to prevent the destruction, loss, or degradation of habitat. The District will participate in the preservation, restoration and management of riparian and wetland areas of regional significance and will not initiate any action that could result in a net decrease in park wetlands. The District will encourage public

access to the Bay/Delta shoreline, but will control access to riparian and wetland areas, when necessary, to protect natural resources.

2. CULTURAL RESOURCE MANAGEMENT (CRM)

CRM1: The District will manage, conserve and, when practical restore parkland cultural and historic resources and sites, to preserve the heritage of the people who occupied this land before the District was established.

CRM2: The District may acquire cultural and historic resource sites when they are within lands that meet parkland acquisition criteria, and will maintain an active archive of its institutional history and the history of its parklands and trails.

CRM3: The District will maintain a current map and written inventory of all cultural features and sites found on park land and will preserve and protect these cultural features and sites "in situ" in accordance with Board policy. The District will evaluate significant cultural and historic sites to determine if they should be nominated for State Historic Landmark status or for the National Register of Historic Places.

CRM4: The District will determine the level of public access to cultural and historic resources using procedures and practices adopted by the Board of Directors. The District will employ generally accepted best management practices to minimize the impact of public use and access on these resources, and to appropriately interpret the significance of these resources on a regional scale.

CRM5: The District will include Native American and other culturally associated peoples in discussions regarding the preservation and land use planning of sites and landscapes significant to their culture.

CRM6: The District will try to accommodate requests by historic preservation groups, Native Americans and other culturally affiliated groups to help maintain and use cultural sites and to play an active volunteer role in their preservation and interpretation.

3. RECREATIONAL FACILITIES AND AREAS (RFA)

RFA2: The District will provide a diverse system of trails to accommodate a variety of recreational users including hikers and joggers, dog owners, bicyclists and equestrians. Both wide and narrow trails will be designed and individually designated to accommodate either single-or multiple users, as appropriate, based on location, recreational intensity, environmental and safety considerations.

RFA4: The District will expand its unpaved multi-use trail system as additional acreage and new parks are added. The District will continue to provide multi-use trails to link parks and to provide access to park visitor destinations.

RFA5: The District will continue to plan for and expand the system of paved, multi-use regional trails connecting parklands and major population centers.

RFA6: The District will continue to develop group and family picnic facilities throughout the parks system and will continue to improve the reservation system.

RFA10: The District will continue to provide special recreational facilities throughout the parklands to broaden the range of opportunities in the parks and to take advantage of existing resources. The

District will ensure that these facilities are compatible with the District's vision and mission, with other parkland resources and priorities, and with public needs and demands.

4. PLANNING FOR REGIONAL PARKS AND TRAILS

PRPT12: To protect park resources while providing for regional recreational use and access, the District will prepare plans (Land Use Plans or System-wide Plans) that describe:

- the various levels of resource protection and recreational intensity in the parks
- development projects and land management strategies for trails and parks.
- planning efforts will include consideration of proposals from the public. The District will strive to create and maintain up-to-date information about each of its parks. Significant changes or amendments to adopted plans will require further public comment and Board action.

PRPT13: Land Use Plans will identify future resource management strategies and recreational use for entire parks and establish appropriate Land Use Designations. The District will continue to prepare Land Use Plans for new parks and will amend existing Land Use Plans as needed to accommodate growth and change.

PRPT17: Where trail alignment is not predetermined by a relationship to established corridors such as roads, railroad rights-of-way, canals, utility corridors, or similar facilities, the District will prepare a study or a plan for the trail, taking into account any factors it deems relevant to alignment and feasibility. After determining a feasible trail alignment, the District will seek to acquire the necessary land tenure and develop the trail for public use. The District may acquire a wider corridor for a proposed trail to provide an enhanced environment for the trail before determining the final alignment for the trail.

PRPT24: The District will seek to locate facilities in a manner that preserves open space whenever possible. The District will design proposed facilities so that their color, scale, style and materials will blend with the natural environment. Park improvements will be designed to avoid or minimize impacts on wildlife habitats, plant populations and other resources.

PRPT27: The District will fully comply with the requirements of the California Environmental Quality Act (CEQA) for the development of new facilities. Evidence of CEQA compliance will be provided in the planning document or separately as a project-specific CEQA document. The District will also comply, when appropriate, with National Environmental Policy Act (NEPA).

Subject: Comments on DEIS re Concord NWS

Hello Ms. Spinelli:

Please find below my comments on the Navy's draft EIS report for the Concord Naval Weapons Station.

Thank you for your attention to this matter. I would appreciate receiving a reply to this email confirming that my comments have been received.

Regards,
Hope Johnson
Sun Terrace area resident

COMMENTS

NOTICE

The Navy should have provided mailed notices of the draft EIS and comment meeting on November 13, 2014, to residents within one mile of the Concord Naval Weapons Station ("CNWS"). Notices to residents within 500 feet is ridiculously inadequate, only covering a few blocks of homes. The areas around the CNWS are heavily residential and include at least one nearby elementary school in the Sun Terrace area. My neighbors and I will be permanently affected by the noise, traffic, pollution, construction, and hazardous contaminants associated with this project. We deserve mailed notice because that is the most likely to reach us. I live approximately one mile from the North Concord BART station (a distance of 5280 feet) and walk to BART to commute to work. My environment and health are without question subject to being affected by the project but I live ten times the distance that the Navy considers adequate notice. At the very least, the Navy should mail out periodic paper notices to nearby areas informing residents and schools of where they can get more information or sign up for email lists. Residents new to the area would then also be able to learn about the project. Costs of notice can be minimized by the use of postcards and should be considered during the budget process. Costs of mailing occasional postcards (maybe one or two per year) could be shared with the City of Concord and would considerably less than lawsuits arising from misunderstandings with or deception toward the public. Outreach to the neighborhood groups alone is not effective. I am on the email list for the Sun Terrace Neighborhood Partnership and did not receive any notices of the draft or comment meeting. Many of my neighbors stated they also did know about the draft or meeting. The Navy should also consider placing signs in public spaces or partnering with the North Concord BART station to place notice signs at the entrance to the station.

0015-1

DRAFT EIS COMMENT MEETING

More than one meeting on the draft EIS should have been planned so that people who were not available on the one meeting day could attend. It is not reasonable to assume everyone would be available on one single day. Further, the Navy should have held at least one meeting that briefly explains what the draft EIS is and the type of comments that are appropriate from the public. For example, I have encountered many people who believe that the Navy can choose Alternative 1, 2, or 3. They do not understand that the No Action Alternative is

0015-2

0015-1
As noted in the EIS, the NEPA process incorporates public involvement at several points. With respect to public notices, the Navy's mailing and e-mail list comprised approximately 4,000 residents, elected officials, non-governmental organizations, and other stakeholders. The public was notified during the scoping process and after the DEIS was completed. Notifications also were placed in local publications as prominently located display advertisements for several days prior to each meeting, as well as in the Federal Register. Documentation was also provided to the California State Clearinghouse prior to scoping and following DEIS publication. The Navy sent e-mail notification of availability to stakeholders, including the City, which posted documents on their respective web sites for review and comment.

0015-2
The Navy selected meeting dates that were advertised well in advance and selected a meeting location that was familiar and easily accessible to the public. The open house meetings were held over a period of several hours and afforded attendees the opportunity to speak with the project team. Poster displays described the EIS process, how to comment, and impacts. Documents were also available for review on line and at local repositories, and the DEIS contained an executive summary to provide an abbreviated overview of the proposed action and impacts. Attendees could provide written comments at the meeting and also during the comment periods via mail, e-mail, and fax.

merely a comparison and that the Navy is just demonstrating that Concord's preferred plan is consistent with legal requirements for the Navy to transfer the property to the city. The draft EIS is 948 pages long and uses terminology with which many residents may not be readily familiar. The Navy could have assisted by providing a brief overview of how to read it.

REVISED DRAFT EIS

I do not understand why there is not a revised draft EIS planned prior to the release of the final report and decision so that members of the public can view and comment on the Navy's responses to comments made by the public, interested groups, and government agencies. The Navy provided a revised draft EIS for the Hunters Point Shipyard in San Francisco and should do the same for the CNWS.

VIEWING COMMENTS

Copies of the original submitted comments on the draft EIS should be made available for viewing by the public. The public should be able to compare the Navy's summary and interpretation of comments with the originals to properly analyze the final report. This is reason to issue a revised draft EIS as well. Private information can easily be redacted from the records. Although contact information and other personal information is private, the content of the comments related to the project is public once it is sent to the Navy.

HAZARDOUS MATERIALS REPORT

The hazardous materials report will not be out until after the draft EIS is finalized. There are still 41 sites that need to be investigated for radiological materials; however, the city of Concord can apply for early transfer of the site once the draft EIS is finalized even though this investigation will not be finished. This seems backwards. The Navy will be reporting its decision on human and environmental consequences of the transfer and build out without knowing exactly what hazardous materials are on the property and exactly where. If the city of Concord were to request early transfer and that transfer were granted, then the cleanup of the property would become the responsibility of whatever developer Concord chose instead of the Navy. This could happen prior to the finalization of the hazardous materials report. Unfortunately, developers are not as accountable to the public as the Navy and not subject to the same federal laws regulating clean up as the Navy. The hazardous materials report should be closer to finished before the draft EIS is finalized. My earlier suggestion that there be a revised draft EIS for people to review would help resolve this problem by allowing people time to comment on a revised draft EIS while having more knowledge of what hazardous materials are found in that investigation and the potential for long term diseases. Also, the city of Concord's web site does not address the possibility of early transfer so, again, a meeting held by the Navy that included a brief overview of the draft EIS would help get information out to the public.

WATER

The draft EIS needs to be revised to more adequately take the drought into consideration when assessing whether or not there is enough water supply in the area to accommodate 12,000 new residences. The CCWD report that declared there will be enough water was done in 2010 prior to the drought becoming so drastic.

0015-2 Continued

0015-2 cont'd
Continued from previous page.

0015-3

0015-3 Where a federal agency makes substantial changes to the proposed action that are relevant to its environmental concerns, or where there are significant new circumstances or information relevant to the environmental effects that have bearing on the proposed action or its impacts, a supplement to a draft EIS (DEIS) or final EIS (FEIS) may be prepared. If an agency decides to supplement its DEIS, as in the case of the Navy's supplemental DEIS for the Disposal and Reuse of Hunters Point Shipyard, the agency must prepare, circulate, and file the supplemental DEIS in the same manner as the DEIS. This includes announcing a Notice of Availability and establishment of a public comment period including a public meeting/hearing, response to public comments, and preparation of a supplemental FEIS. With respect to the 2014 Concord BRAC DEIS, there have been no substantial changes to the proposed action or significant new circumstances that would necessitate a supplemental DEIS; thus, an additional comment period is not warranted.

0015-4

0015-5

0015-4
Public comments submitted on the DEIS, and the Navy's responses, can be viewed in Appendix K of the FEIS. Private information is redacted from the public record.

0015-5
As explained in Section 3.8.2.3, the Navy is required to prepare a FOST or FOSET prior to property transfer.

The Navy issued the Draft Final FOST supporting Phase I transfer on June 30, 2016 (TriEco-Tt 2016c). The purpose of the FOST document is to summarize how the requirements and notifications for hazardous substances, petroleum products, and other regulated materials have been satisfied for former NWS Concord for the property to be conveyed in a Phase I transfer under EDC or PBC (Navy August 2016). Section 3.8 (Hazards and Hazardous Substances) of the EIS provides the existing site conditions with respect to the ER Program and compliance programs for hazardous waste and materials for former NWS Concord and has been updated to include information from

current environmental program documents and the current FOST.

Early Transfer Authority (TA) has been granted to state governors or a governor and the U.S. EPA administrator for sites listed on the NPL for property transfer prior to completion of all environmental remediation at bases (Navy August 2006). Under an Early Transfer, property can be conveyed by deed prior to all necessary remediation having been completed, and the Navy or the transferee can conduct the necessary cleanup actions following transfer. A FOSET, similar to a FOST, would be required to document the environmental condition of property including documentation of previous investigations conducted at the sites.

If an Early Transfer was contemplated, an established process would be adhered to that includes public participation prior to review/approval by the governor and U.S. EPA administrator (Navy August 2006). Cleanup actions conducted under CERCLA require oversight and approval by applicable federal and state environmental regulatory agencies.

Regarding investigations for radiological materials, the Navy has conducted fieldwork at 48 sites and is in the process of documenting the findings in Site Inspection (SI)/Scoping Survey reports. The Navy will coordinate with the appropriate federal and state agencies regarding final recommendations for these sites.

Section 3.8.5 has been updated to include the current information above concerning the radiological investigations.

Obviously, the CCWD report needs to be updated. In the last year, the drought has taken on much more significance than this report reflects. In addition, the draft EIS states that, when the amounts that were anticipated for the new build out were calculated, they had to take into consideration that there was less used in 2013 because of the drought; however, it does not go on to make any statements about how a continuing drought would change this analysis. Further, although the draft EIS claims there is an adequate water supply, it goes on to state that conservation methods could reduce the need for water by newly planned communities. We are already struggling to conserve water and face an unknown future about our water supply. This must be addressed in a revised draft EIS.

TOD

The draft EIS fails to analyze whether or not TOD development and "smart growth" actually encourages pedestrian traffic and use of public transportation over vehicular traffic. There appears to be little evidence that TOD development works. The TOD areas of the Walnut Creek and Pleasant Hill BART stations have just created a lot more vehicular traffic and not much more pedestrian traffic. The cities of New York and San Francisco have much better public transportation systems and people there still try to use their cars. A better analysis of this is required in the draft EIS considering the Sun Terrace area is already having problems with overflow parking in their neighborhood when the North Concord BART parking lot is full. In fact, a meeting took place about that parking situation at the same time as the Navy's meeting to comment on the draft EIS. This is unfortunate since the planned build out will only increase those same traffic and parking issues.

MITIGATION ISSUES

Some of the mitigation proposed by the city of Concord is not thoroughly analyzed in the draft EIS. The document is 948 pages on so it is difficult for one individual to review and comment on all the mitigation issues. One example of an item that needs to be further assessed in the report is the widening of Panoramic Drive and Port Chicago Highway to accommodate the what the reports admits will be horrific traffic. There is no analysis of whether or not residents would lose their homes in order to widen these roadways.

IRREPLACABLE VIEWS

Views from the Sun Terrace neighborhood closest to the North Concord BART station are some of the only remaining full views of Mt. Diablo in Concord. The draft EIS hints that these views will be broken up by the high density TOD planned near only the entrance to the North Concord BART station. It does not treat the loss of these views as detrimental, just as something that will occur. Maintaining these irreplaceable views will make the development desirable to people rather than just creating another set of ugly square buildings. The evaluation of placing height limits in this area should be included in this draft EIS to maintain irreplaceable views; especially considering that Concord already has a number of high-rise office buildings in downtown that it can't even currently fill.

0015-6

0015-7

0015-8

0015-9

0015-6
The Navy's EIS was prepared to assess the environmental impacts related to the reuse of NWS Concord. The Contra Costa Water District (CCWD) has responsibility and authority over the delivery and acquisition of water to the County, including the City of Concord. The CCWD has considered the Area Plan in its future projections and would continue to account for future needs, including during periods of drought. In addition, the CCWD recently completed the expansion of the Los Vacqueros Reservoir, which will significantly increase the storage capacity in the district. This information was added to Section 4.12.1.1 of the FEIS to more fully describe water supplies.

0015-7
As stated in Section 1.2, the Navy's disposal of the surplus former NWS Concord property into non-federal ownership and the subsequent reuse of the property by the local community is the focus of the EIS. The purpose of the proposed action is to dispose of surplus property at the former NWS Concord for subsequent reuse in a manner consistent with the policies adopted by the City of Concord during reuse planning that took place between 2008 and 2012. The disposal of surplus property at the former NWS Concord is the responsibility of the Navy, and the EIS evaluated transportation- and traffic-related impacts. As the LRA, the City of Concord is responsible for the implementation of its reuse plan. The City is proposing a number of measures to encourage use of alternate transport modes, including financial, system, and demand incentives. As stated in the Concord Reuse Project Area Plan Climate Action Plan (Climate Action Plan) the City's application of the VMT Reduction Strategies is projected to achieve a 21 percent reduction in transportation-related GHG emissions, which was prepared in response to state and regional targets. The Climate Action Plan elaborates on the planned VMT Reduction Strategies including land use strategies, connected multi-modal transportation networks, parking management, and transportation demand management. The Climate Action Plan also states that VMT strategies are most effective when applied together to impact travel behavior.

The Specific Plan process and CEQA review that will be required of the LRA for entitlement of the property will address traffic mitigation at more appropriate levels of detail.

0015-8

The City has no plans to use private property to support widening or alignment modifications for Panoramic Drive or Port Chicago Highway. However, as noted in the previous comment response, the Specific Plan process and CEQA review that will be required of the LRA for entitlement of the property will address traffic mitigation at more appropriate levels of detail.

0015-9

The EIS is intended to provide an objective view of potential impacts, both positive and adverse, on resources within the Project Area. As noted in the EIS, disposal and redevelopment of the former NWS Concord will change the current visual condition of the installation to include a variety of urban uses and park and recreational facilities, as well as maintaining existing open spaces. A transitional green buffer of varying distances would be developed around the majority of the site, and a network of green corridors are proposed in strategic locations (ridgelines, between districts/villages) that offer opportunities for view corridors from existing neighborhoods and viewpoints around the City of Concord toward Mount Diablo and the Los Medanos Hills. In addition, redevelopment of the site would maintain open space areas that help minimize view obstruction and maintain the existing visual character of parts of the site, particularly east of Mt. Diablo Creek and south of Bailey Road.

Panoramic Drive in the Sun Terrace neighborhood is described as a Key Observation Point (KOP 5). From KOP 5, views of the former NWS Concord would include the Central Greenway, North Concord TOD Neighborhood, and North Concord TOD Core districts. As indicated in the EIS, development of Alternative 1 would be highly visible because it would take place in the middle ground, is at and above eye level, and would take place over a prolonged period of time. The Central greenway would be developed in the middle ground to provide a connection between the North Concord/Martinez BART Station, TOD districts, village neighborhoods, and the adjoining existing communities. The North Concord TOD Core is anticipated to include a combination of mid-rise, mixed-use office, retail, and multi-unit housing development (from five to seven stories in height). The scale of buildings would step down adjacent to the Sun Terrace neighborhood, in the vicinity of KOP 5. Due to the nature and the heights of the proposed development, views of the Los Medanos Hills and ridgelines may be seen above some of the rooflines, in between buildings at roadways, and above and in between vegetative plantings in the Central greenway.

The heights of the buildings in the North Concord TOD Core district in the middle ground would be lower than five to seven stories in order to provide a transition to the Sun Terrace neighborhood. However, the EIS acknowledges that taller buildings in the distance may modify or obscure views of the Los Medanos Hills and ridgelines. Overall contrast between current conditions and Alternative 1 would be moderate to strong for KOP 5.

In accordance with mitigation measures in the Area Plan, future developers of the former NWS Concord will be required by the City of Concord to incorporate design best management practices (BMPs) into site development plans that would minimize impacts on views from State Route 4 (KOP 3) and the Sun Terrace neighborhood (KOP 5). Through the implementation of design BMPs, potential impacts would be mitigated, and views from KOP 3 and KOP 5 would be significantly altered but not substantially degraded, and no significant long-term adverse impacts would result.

The Specific Plan process and CEQA review that will be required of the LRA for entitlement of the property will address visual impacts at more appropriate levels of detail.

Subject: NWS Concord EIS Comments

Nov 25, 2014

Director, NAVFAC HQ, BRAC PMO West, c/o Erica Spinelli, NEPA Project Manager:

I was pleased to attend the Nov 13, 2014, public meeting regarding the draft environmental impact statement (DEIS) for the disposal and reuse of the former Naval Weapons Station Seal Beach, Detachment Concord. I appreciate the opportunity now to share comments on this draft document. My comments are offered both as a private citizen and as a member of the Concord Historical Society.

The DEIS clearly represents a great deal of research and careful thought and attention to detail. In its final form it should prove to be a reliable and valuable resource and guide as the disposal and reuse of this former weapons station proceeds.

I will leave specific comments regarding the traffic flow and such to others more qualified. I am familiar with the site's natural and cultural resources. A great deal of study and documentation has been conducted in these areas, as this statement summarizes well. While I would have liked to see the stone cistern (P-07-00860, referenced on page 3-62) classified "NRHP qualified," I differ to the judgment presented in the DEIS. I hope this stone cistern and its immediate surroundings (i.e., nearby pond, "NRHP qualified" bedrock milling facility, nearby pine tree test grove, surrounding magazines and Building 97) might be preserved as an environmental and site history interpretive area. 0016-1

In short, I have no criticisms, only compliments. *May I request a hard copy of the **Final EIS** when available*? I would like to place it in the holdings of the Concord Historical Society. 0016-2

May I note a spelling error? My last name is misspelled four times on pages 3-62, 3-65 and 9-15. 0016-3

Yours truly,

John Keibel

[redacted]

P.S. Please keep me on your mailing list. As for my name and address, you need not keep these private.

Jesus come to obey every commondment we broke.
He came to suffer for every sin we committed.
He came to die the death we deserve.
He received our hell.
He gives us heaven.

0016-1
As described in Section 3.6, P-07-00860 (the stone cistern) was not identified as eligible for listing in the NRHP (Roland-Nawi 2014) in consultation with the CA SHPO and other consulting parties such as the Concord Historical Society and the East Bay Regional Park District.

With respect to the proposed preservation of the stone cistern, the EBRPD will be developing a Land Use Plan that will identify future land uses within the Conservation Open Space Area.

0016-2
All interested parties who requested a copy of the FEIS have received one.

0016-3
Table 3.6-1, Section 3.6.3.1, and Chapter 9 have been revised as suggested.

RE: Draft Environmental Impact Statement (DEIS) for the Reuse of the Naval Weapons Station Seal Beach Detachment Concord, CA (ER 14/658)

Dear Ms. Spinelli:

I write to you on behalf of the Friends of Port Chicago National Memorial. We appreciate the opportunity to review and comment on the "Draft Environmental Impact Statement (EIS) for the Disposal and Reuse of the Former Naval Weapons Station Seal Beach, Detachment Concord, Concord, California," dated October 2014. We support both Alternative 1 (the preferred alternative) and Alternative 2. Each of these alternatives provides for 2,537 acres of open space to be owned and managed by the East Bay Regional Park District (EBRPD).

The Port Chicago Naval Magazine National Memorial's enabling legislation allows for a joint visitor center to be established in partnership with EBRPD for the purposes of providing interpretation and education of the Port Chicago disaster and its aftermath to a broad audience. We are excited about the potential for this visitor center to be established on lands conveyed to the EBRPD as part of this planning process. As soon as the Navy conveys this land to EBRPD, we will work with the National Park Service (NPS) and EBRPD in the planning effort for this visitor center.

Sincerely,
Diana McDaniel

1	N/A	N/A	GMS	**OVERALL COMMENT:** In an effort to maximize the use and relevancy of the new regional park, and in an effort to expose as many people as possible to the nationally significant history of the Port Chicago Naval Magazine National Memorial, we concur with the NPS' specific recommendation for the City of Concord and the future developers of the western portion of the land being conveyed. Although it will be important to provide public transportation and parking areas for privately owned vehicles to access the regional park, in order to maximize use of the regional park by future residents including children, adults, and people with mobility issues, it will be *especially* important to design for safe and pleasant access from within the future residential area *to* the regional park by walking, cycling or other self-propelled methods.
2	ES-5	6	GMS	Conservation Open Space Alternative 1: Please edit last sentence of paragraph to read: "This district would include some limited recreational uses, including trails, shaded seating areas, and interpretive areas including a new visitor center to be co-managed by EBRPD and the National Park Service."
3	ES-6	1	GMS	Please clarify how the Conservation area along the ridgeline of the Los Medanos Hills would be managed under Alternative 2. Currently the text in the Executive Summary says it will be "similar" to Alternative 1. If it is in fact intended to mean identical, not just similar, please state. If there are some differences between the future EBRPD conservation land across the two action alternatives, please specify.
4	ES-6	1	GMS	Conservation Open Space Alternative 2: Similar to comment for Alternative 1: Please include language such as: "This district would include some limited recreational uses, including trails, shaded seating areas, and interpretive areas including a new visitor center to be co-managed by EBRPD and the National Park Service."
7	2-2	2	GMS	Recommend that EBRPD is also recognized (in addition to City of Concord) as responsible for implementing the reuse of this land.

0018-5

0018-6

0018-7

0018-1
Comment noted.

0018-2
Comment noted. The requested change has not been incorporated because the Area Plan has not been amended; the proposed action evaluated in this EIS remains reuse of the property in a manner consistent with the City of Concord's Area Plan.

Chapter 1.10 of the FEIS, however, indicates that Sections 2, 3, and 4 of the FEIS have been revised to recognize that the EBRPD has begun development of the Concord Hills Regional Park Land Use Plan and will be responsible for completing environmental review as required under CEQA.

0018-3
The Executive Summary has been revised to provide clarification that the Conservation area along the ridgeline of the Los Medanos Hills would be managed as proposed in Alternative 1.

0018-4
Please see response to comment 0018-2.

0018-5
The Navy acknowledges that the EBRPD, as a future property owner and manager of the conservation open space area/regional park, would be implementing reuse of the property. However, the intent of this paragraph is to differentiate between Navy and City responsibilities, specifically in regard to the City's role as the Local Reuse Authority and the party responsible for implementation of the Area Plan. Section 2.1 of the FEIS has been revised to clarify this.

0018-6
Please see response to comment 0018-2.

0018-7
Please see response to comment 0018-3.

Subject: CNWS EIS Feedback

Hi Erica,

I understand you are looking for feedback on the Concord Naval Weapons Station Project options.

I am a 32 year resident of Concord and I have raised my family here. I want to see Concord grow and prosper, with top quality housing for families, good jobs, and recreational opportunities.

My preference is Alternative 1, which I believe has been called the "Clustered Villages" option. This includes 12,200 new housing units and 6.1 million square feet of commercial space.

I am very happy with the extensive community input and the decision making process the City of Concord has used thus far. The "Clustered Villages" plan, selected by a diverse and representative task force from our city, provides the best balance of interests and will hopefully be a wonderful addition to Concord.

Thanks!!!
Mike McDermott

Subject: Review and Comment of Draft Environmental Impact Statement (EIS) for the Former Naval Weapons Station Seal Beach

Dear Ms. Spinelli, et. all:

The Department of Toxic Substances Control (DTSC) has reviewed the Document entitled "Draft Environmental Impact Statement (EIS) for the Disposal and Reuse of the Former Naval Weapons Station Seal Beach, Detachment Concord (NWS Concord), Concord California" dated October 2014. The EIS presents an analysis of the U.S. Department of the Navy's (Navy's) disposal of surplus property at the former NWS Concord, and the subsequent reuse of the property by the local community. EIS sections 3.8 and 4.8 discuss the release of hazardous waste at NWS Concord, and describe the Navy's actions to remediate these releases.

The EIS notes the former NWS Concord was placed on the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) National Priorities List on December 16, 1994. On June 12, 2001, the Navy entered into a Federal Facility Agreement (FFA) with EPA Region 9, the San Francisco Bay Regional Water Quality Control Board (Water Board), and DTSC. The FFA requires that the Navy investigate and remediate actual or threatened releases of hazardous substances, pollutants, and contaminants at the former NWS Concord. The FFA listed the areas and sites considered to be areas of contamination, established goals and responsibilities among the Navy and the regulatory agencies, and set enforceable cleanup schedules for the sites.

0020-1

DTSC will continue to work with the Water Board, EPA Region 9, the Navy, and all interested parties to ensure protection of human health and the environment whenever the Navy transfers property. Please contact me with any questions at (916) 255-9719 or jim.pinasco@dtsc.ca.gov.

0020-2

Respectfully,
Jim Pinasco

Subject: Review of the Draft Environmental Impact Statement (DEIS) for the Reuse of the Naval Weapons Station Seal Beach Detachment Concord, CA

Dear Ms. Spinelli:

Thank you for the opportunity to comment on the Review of the Draft Environmental Impact Statement (DEIS) for the Reuse of the Naval Weapons Station Seal Beach Detachment Concord, CA. We have the following comments to assist your preparation of the Final EIS.

The Department of Interior supports both Alternative 1 (the preferred alternative) and Alternative 2. Each of these alternatives provides for 2,537 acres of open space to be owned and managed by the East Bay Regional Park District (EBRPD)--an element of the plan the Interior has shown support for as demonstrated in the Spring of 2014 when it recommended the Public Benefit Conveyance of these lands to the EBRPD through the Federal Lands to Parks program.

The conveyance of these lands to the EBRPD is supported not just by the larger NPS organization, but also by the managers of the Port Chicago Naval Magazine National Memorial, a local unit within the national park system. The Port Chicago Naval Magazine National Memorial's enabling legislation allows for a joint visitor center to be established in partnership with EBRPD for the purposes of providing interpretation and education of the Port Chicago disaster and its aftermath to a broad audience. We are excited about the potential for this visitor center to be established on lands conveyed to the EBRPD as part of this planning process. As soon as the NPS Federal Lands to Parks program conveys this land to EBRPD, the NPS and EBRPD will be able to move forward with the planning effort for this visitor center.

In addition to expressing our general support of the preferred alternative, the Interior would like to provide a few specific ideas and editorial comments for your consideration. These are included in the attached table. If you have any questions about these comments please contact

0021-1

Please see comment letter 18, which contains responses to comments 1 - 9 in the attached table. With respect to comment 10 in the table, Section 3.6.4 of the FEIS has been corrected per the comment. With respect to comment 11 in the attached table, Table 2.4 notes that Native American resources were not identified through tribal consultation and, as noted in the comment, Section 3.6.4 documents the Navy's finding that Site CA-CCO-680 is eligible for the National Register of Historic Places (NRHP) and that the site "carries religious and cultural significance with regard to contemporary ethnographic perspectives about death and burial." To clarify, these two statements are referring to different categories and definitions of resources and their significance. Despite the NRHP eligibility and significance of Site CA-CCO-680 to contemporary Native American people, consultation with Native American tribes (Federally Recognized Indian Tribes) has not revealed "Native American Resources" such as those meeting the Department of Defense's definition of "Protected Tribal Resources": "Those natural resources and properties of traditional or customary religious or cultural importance, either on or off Indian lands, retained by, or reserved by or for, Indian tribes through treaties, statues, judicial decisions, or executive orders, including tribal trust resources."

0021-1

Gretchen Stromberg, Chief of Planning and Administration, gretchen_stromberg@nps.gov or 510-232-1542 x6302.

Thank you for the opportunity to review this project.

Comment noted.

As noted in the EIS, the purpose of the proposed action is to dispose of surplus property at the former NWS Concord for subsequent reuse in a manner consistent with the policies adopted by the City of Concord. The need for the proposed action is to provide the local community the opportunity for economic development and job creation.

Alternative 1 (the Preferred Alternative) is reuse of the surplus property consistent with the City of Concord's Area Plan, as adopted. As discussed in Chapter 1, the Area Plan upon which Alternative 1 is based was the result of an extensive reuse planning process that took place between 2008 and 2012 undertaken by the City of Concord, during which seven alternatives were evaluated. All seven of the alternatives were variations on mixed-use development. In accordance with NEPA, the Navy is also evaluating an alternative to the proposed action, Alternative 2 (Intensified Reuse), which is also consistent with the policies developed by the City of Concord during the reuse planning process but represents a higher intensity of use overall.

Please see the EIS for a discussion of socioeconomic impacts (Section 4.3).

Subject: Concord Community Reuse Project Draft Environmental Impact Statement Review

Dear Ms. Spinelli:

Thank you for the opportunity to comment on the "Draft Environmental Impact Statement (EIS) for the Disposal and Reuse of the Former Naval Weapons Station Seal Beach, Detachment Concord, Concord, California (October 2014)" (DEIS) prepared by the Department of the Navy (Navy). This letter presents the City of Concord's comments on the DEIS, and continued support for the Navy's disposition of the Inland Area of the Former Naval Weapons Station, which is addressed in more detail in Section 1.4.

Section 1 - Introduction

Section 1.1 - Base Closure

As described in the DEIS, in 2008, the Navy closed the former Naval Weapons Station Seal Beach Detachment Concord (NWS Concord), located in the City of Concord, in accordance with the Defense Base Closure and Realignment (BRAC) Act of 1990, as amended (BRAC Law). Approximately 7,000 acres (60 percent of the land area) was transferred to other Department of Defense and federal agencies. The remaining 5,028 acres were determined surplus to the needs of the federal government (72 Federal Register [FR] 9935). The Navy, in accordance with the BRAC Law is now considering how to dispose of the surplus property.

The BRAC process includes multiple steps from base closure to the ultimate final disposal (conveyance) of federal surplus property from federal ownership. Following the closure decision, BRAC provides for a reuse and disposal planning phase. This phase consists of the local community's reuse planning, identification of the needs of the homeless, environmental impact analysis, and the identification of potential disposal options.

Section 1.2 - Reuse and Disposal Planning

As part of this base reuse and disposal planning phase, in 2005 the City of Concord was designated the Local Reuse Authority (LRA) to plan for the reuse of the surplus property at the former NWS Concord (71 FR 6274). Commencing in the spring of 2006, the City conducted a comprehensive community planning process and evaluated seven alternatives for reuse of the surplus property. These alternatives for reuse of the former NWS Concord were evaluated in an Environmental Impact Report (EIR), conducted in compliance with the California Environmental Quality Act (CEQA) that was certified by the City of Concord in 2010 (Final EIR or FEIR).

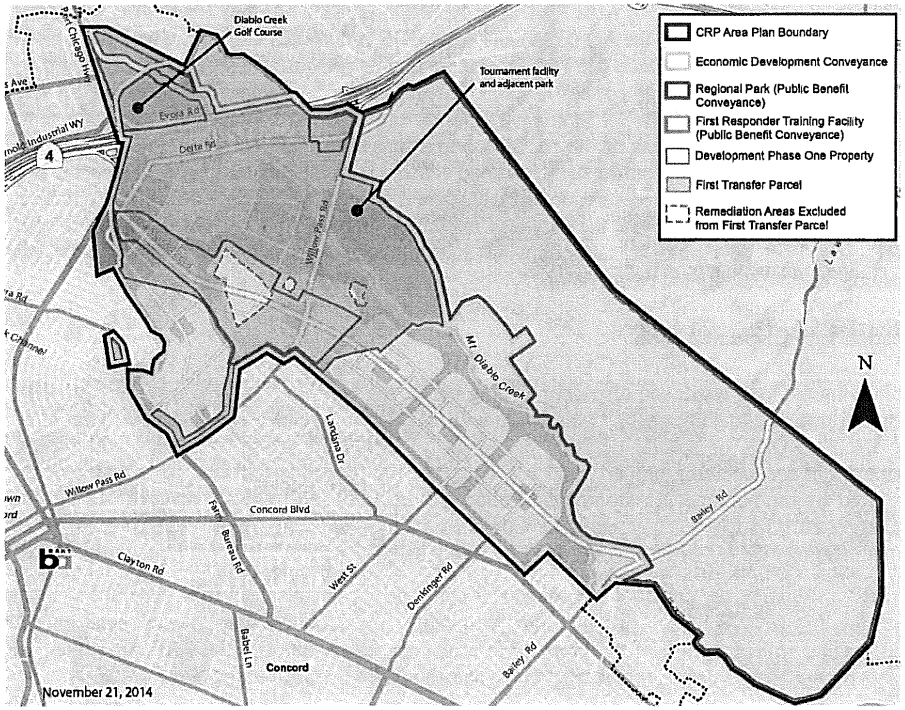
In 2012, the City of Concord refined the reuse plan into an area plan, adopted the Concord Reuse Project (CRP) Area Plan (the "Area Plan" or "CRP Area Plan"), certified an Addendum to the Final EIR (EIR Addendum), and amended Concord's citywide Concord 2030 General Plan to include the Area Plan. By incorporating the Area Plan into the General Plan, a document required by the State of California and designated by the courts as the "constitution for future development" in California jurisdictions, the City indicated its policy guidance for reuse of the former NWS Concord.[1] As part of the Area Plan approval process, the City adopted a Mitigation Monitoring and Report Plan (MMRP) that incorporates all of the mitigation measures contained in the certified Final EIR and its Addendum. As such, the local reuse planning and environmental impact analysis have been done, and it will be the responsibility of future developers or owners of the property under the direction of the City of Concord to implement the Area Plan and MMRP-required environmental mitigation measures. These mitigation measures and Area Plan policies are integral components of the Area Plan and will be implemented regardless of whether they are addressed in the Navy's EIS.

Section 1.3 - Site-Wide Resource Planning and Permitting

The Area Plan encourages the City to obtain site-wide permits from State and federal resource agencies and to adopt a site-wide plan that addresses the conservation and restoration of sensitive biological resources. [See CRP Area Plan, Wetlands Conservation Policies (Policy C-7.2), Special Status Species Policies (Policy C-8.7)]. In an effort to implement the Area Plan's policies, the City applied to the U.S. Army Corps of Engineers (ACOE) for an individual Clean Water Act (CWA) permit that would authorize the fill of certain waters of the United States

[1] Since the former NWS Concord is located entirely within the City of Concord, the City's General Plan applies to the entire site. The County of Contra Costa has land use authority over land located outside of the City, in unincorporated areas of Contra Costa County, and its general plan therefore does not apply to the site.

("jurisdictional waters") in connection with the development and creek restoration/flood control activities identified in the CRP Area Plan. The ACOE's issuance of a CWA permit is subject to the federal Endangered Species Act (ESA) and the ACOE is currently consulting with the United States Fish and Wildlife Service (USFWS) to ensure that its permitting action will not jeopardize the continued existence of any species listed as "threatened" or "endangered" under the ESA (50 CFR 402.14(a)).[2] The USFWS's Biological Opinion and associated Incidental Take Statement, which will address the effects of the ACOE's permitting action and the interrelated CRP Area Plan actions, will cover the entire Area Plan and address both CRP Area Plan development and creation, enhancement, and preservation of endangered species' habitats. To further facilitate a site-wide conservation program, the City also intends to process State permits that address both CRP Area Plan development, and site-wide State endangered species, and aquatic resource creation, enhancement, and preservation.



Section 1.4 - Disposal Action

Following the base reuse and disposal planning phase, the Navy entered into a surplus property disposal decision-making phase. This phase will include the issuance of a "Disposal Record of Decision" (ROD), or similar decision document. During this phase, the Navy will review applications for receiving property and will complete the federal environmental review process required by the National Environmental Policy Act of 1969 (NEPA), as amended (42 United States Code [U.S.C.] 4321 *et seq*); the Council on Environmental Quality (CEQ) regulations implementing NEPA (40 Code of Federal Regulations [CFR] 1500-1508); and Navy procedures for implementing NEPA (32 CFR 775). The Navy's final Environmental Impact Statement (EIS), evaluating the potential environmental consequences of disposal from federal ownership of the former NWS Concord and the reasonably foreseeable environmental consequences associated with the reuse of the property in a manner consistent with the CRP Area Plan, will support the Navy's decision-making process and should be included in the Navy's ROD.

The BRAC property disposal action is comprised of three distinct parcels: (1) the Economic Development Conveyance area, (2) the Regional Park/Open Space Area, and (3) the County Sheriff/Fire Training and Command area. (Figure 1) The Navy's DEIS covers all three primary transfers.

[2] Section 7 of the ESA provides that each federal agency must ensure, in consultation with the Secretary of Interior or Commerce, that any actions authorized, funded, or carried out by the agency are "not likely to jeopardize the continued existence of any endangered or threatened species or result in the destruction or adverse modification of lands determined to be critical habitat." 16 U.S.C. § 1536(a)(2). The term "agency action" is broadly defined in a manner that includes nearly all actions taken by federal agencies as well as actions by private parties which require federal agency permits. 50 C.F.R. § 402.02 (2003).

Figure 1: Disposal Areas

In accordance with the BRAC Law and process, the City of Concord will submit an Application to Acquire Surplus Federal Property through an Economic Development Conveyance for the City development area. The footprint of the City's anticipated Economic Development Conveyance request (the "EDC Footprint") is outlined in yellow in Figure 1, above. The area includes the land within the CRP Area Plan "Planning Area Boundary," excluding the Regional Park outlined in green and the First Responder Training Facility outlined in blue.

The East Bay Regional Park District (EBRPD) submitted an application to the U.S. Department of the Interior to acquire surplus federal property through a Public Benefit Conveyance for the Regional Park area, and that application is under review by the National Park Service. The park would include interpretive and recreational facilities, including trails, passive outdoor recreation facilities, and interpretive centers. Additionally, the site would support extensive habitat restoration and environmental enhancement that will provide mitigation for the development envisioned by the CRP Area Plan within the EDC Footprint.

The Contra Costa County Sheriff's Department and the Contra Costa County Fire Protection District are applying for a Public Benefit Conveyance to construct a joint training facility for first responders. This application has been submitted to the U.S. Department of Homeland Security and will be evaluated by the Federal Emergency Management Agency. The facility would include space for a communications and operations center, as well as administrative offices.

After the Navy has issued its final disposal decision, completing the decision-making phase, the Navy will dispose of the property. The Navy may dispose of the surplus property as one conveyance or convey the property in multiple parcels. Any Public Benefit Conveyance, which includes a federal sponsoring agency other than the Navy, will also require the sponsoring federal agency's approval.

Section 2 - Remediation

Under the BRAC Law, the Navy is responsible for remediating hazardous materials from the site in connection with its disposal action. The EIS should make it clear that the Navy, under BRAC Law, the Comprehensive Environmental Response, Compensation and Liability Act of 1980, as amended (42 U.S.C. Section 9601 *et seq*) (CERCLA), and other federal environmental statutes, such as the Resource Conservation and Recovery Act (42 U.S.C Section 6901 *et seq*) (RCRA), is solely responsible for all hazardous substances remediation associated with the Navy's current and former activities at the site, even if the remediation occurs, or becomes necessary, after the Navy has conveyed the property out of federal ownership.

The fourth paragraph of DEIS, 4-75 (Section 4.8.1.1), which explains the contents of Section 120(h) of CERCLA, should disclose that this covenant also requires the Navy to remediate newly discovered hazardous substances found after transfer, if such contamination can be attributed to the Navy. This is the primary reason access is reserved.

The fifth paragraph of DEIS, 4-75 (Section 4.8.1.1), refers to a Memorandum of Agreement (MOA) with the California Department of Toxic Substances Control (DTSC) regarding the implementation of land use or institutional controls. The Navy's Finding of Suitability for Transfer (FOST) or Finding of Suitability for Early Transfer (FOSET) will describe the clean-up actions, characterizing the efforts made to identify hazardous substances and the reports that disclose and assess the nature and extent of those substances, including the various categories of hazardous substances (pesticides, petroleum products, munitions and explosives of concern, polychlorinated biphenyls, etc., and related constituents) that may have been, or continue to be, on a particular site. In addition, the FOST or FOSET will address the covenants, notices, land use restrictions, and institutional controls that should be included in the transfer deed(s). Therefore, an MOA may not be necessary.

The third paragraph on DEIS, 4-77 (Section 4.8.2.1), states the Navy will complete its investigation and remediation activities prior to transfer. This will not be the case if the Navy utilizes CERCLA's "early transfer" process.

0024-1

0024-1
CERCLA § 120(h)(3)(A)(ii) and (B) require that a deed covenant be provided to the future property owner warranting that "all remedial action necessary to protect human health and the environment" and "any additional remedial action found to be necessary after the date of such transfer shall be conducted by the United States."

Section 3.8.2.1 describes key CERCLA requirements pertaining to Navy responsibilities for site cleanup before and after property transfer. Additional clarifying information regarding CERCLA requirements for property deed covenants has been included in Section 3.8.2.3 (Finding of Suitability to Transfer).

0024-2

0024-2
Paragraph 4 under Section 4.8.1.1 is intended to indicate that the implementation and enforcement of Institutional Controls (ICs) are legal mechanisms to ensure that human health and the environment are protected from hazardous substances at a site. In this context, Navy retains access rights in order to ensure the ICs can be enforced through inspections over time.

Per Comment 24-1, Section 3.8.2.3 has been updated to more thoroughly describe CERCLA covenants. No revisions have been made to Section 4.8.1.1. to address this comment.

0024-3

0024-3
To clarify, the 2000 Navy/DTSC MOA referenced in Section 4.8.1.1. is a programmatic-level agreement between the agencies about how to implement CERCLA ICs.

In accordance with the 2000 Navy/DTSC MOA, the Navy intends that CERCLA ICs will be implemented via restrictive covenants in Navy deeds and in Navy/DTSC Covenants to Restrict Use of Property (CRUPs). No additional negotiation or execution of an MOA is necessary to implement a CERCLA IC at NWS Concord.

No changes have been made in the EIS text.

0024-4

0024-4
The following text has been added to the third paragraph of Section 4.8.2.1 and the second paragraph of Section 4.8.3.1. to account for the potential for an early transfer in both Alternatives 1 and 2:
"Additionally, investigation and remediation activities and

regulatory concurrences could be completed under the Early Transfer process discussed in Section 3.8.2.1.”

The "remediation plan" (MMRP Hazardous Materials 4) was included in the MMRP only in the event the property was subject to an early transfer. In that case, the property owner or developer would have to prepare a hazardous material remediation plan, to ensure the property is fit for the intended land use. If the property is transferred under a FOST, the Navy will be required to complete remediation before conveying the property. For example, the Navy will be responsible (either financially or for performing the necessary work needed) for remediation of Site 22 to accommodate residential land uses before completing the conveyance through a FOST. If the Navy makes an early conveyance, through a FOSET, and the clean-up is privatized and addressed through an "Environmental Services Cooperative Agreement" (ESCA), the ESCA will contain a remediation plan that the Navy will pay for and the City will implement. An early transfer with an ESCA will not affect the Navy's obligation or responsibilities under CERCLA (or otherwise affect the application of CERCLA to the site) to complete the clean-up, and the Environmental Protection Agency and other agencies with regulatory authority over hazardous substances will address the required level of clean-up.

Section 4.8.2.4.5 (DEIS, 4-96) states that lead in soil beneath Building IA-25 will not be addressed under the Navy's Environmental Restoration (ER) Program because it is not a release under CERCLA. Lead in the soil is considered a release under CERCLA, and the EIS should be revised accordingly.

Section 3 - Site-Wide and Future Resource Permitting

If the City is able to secure site-wide permits from the ACOE, RWQCB, USFWS, and California Department of Fish and Wildlife as described in Section 1.3, it will streamline future development and conservation activities on the site. As explained in the MMRP, Mitigation Measure Biological Resources 1, if the City has adopted a site-wide plan for conservation and restoration of sensitive biological resources, each remedial action plan or development application will be reviewed for consistency with the plan. If, however, the City does not secure site-wide permits, future property owners or developers would be responsible for securing any necessary State or federal resource permits, and would have to demonstrate to the City that impacts to wetlands, creeks, riparian habitat, and listed species or their habitat have been avoided to the extent practicable (MMRP, Biological Resources Mitigation Measures Biological Resources 1-4).

Although the DEIS acknowledges the City of Concord's site-wide permitting effort, and generally presumes the City will secure such permits, the DEIS also concludes that the City will "coordinate" with the ACOE and the Regional Water Quality Control Board (RWQCB) "regarding specific mitigation requirements" and to "identify applicable permits/approvals" during the City's "review and approval of development applications." (See, e.g., Table 7-1, Water Resources.) As explained above, the City has a CWA permit application pending with the ACOE, which if issued and certified by the RWQCB,[3] will specify the required mitigation

[3] Any permit issued by the ACOE will be subject to certification by the RWQCB that it complies with State water quality standards. 33 U.S.C. § 1341.

0024-5

0024-5
This comment clarifies the City's commitment regarding a Remediation Plan. As discussed in the Response to EPA Comment 11-14, Section 4.8.2.1 of the EIS has been updated to clarify that the City will require a Remediation Plan only in the event of an Early Transfer.

As described in Section 3.8.2.3., the Navy may transfer property after the completion of environmental cleanup and a FOST, or through an Early Transfer and FOSET.

No decisions about an Early Transfer have been made concerning IR Site 22 or other open ER Program sites at the former NWS Concord. In particular, an approach to the cleanup of Site 22 will be identified as the Navy moves through the CERCLA process toward ROD. Should the City of Concord formally request an Early Transfer, the Navy will consider this request in the context of discussions/negotiations regarding the Economic Development Conveyance.

0024-6

0024-6
The third paragraph of Section 4.8.2.4.5 has been updated with the following text:
"Lead from LBP reported to be in soil beneath Building IA-25 (IRP Site 29) is being addressed under the ER Program, as discussed in Section 3.8.3.1.1"

measures, and the City will make all applicable conditions of a site-wide CWA permit (and any other site-wide permits issued to the City) conditions of all City-issued development approvals. However, the City would not coordinate further with these agencies while processing site-specific land use applications on the appropriate mitigation measures, since those measures will be specified in a site-wide permit. Alternatively, if the City does not receive a site-wide permit, the property owner or developer will be required to identify and secure any necessary project-specific permits from those agencies, without involvement by the City.

The DEIS also concludes that "future developers" will be required to minimize impacts to jurisdictional waters "to the maximum extent practicable" under Sections 404 and 401 of the CWA and Section 1600 of the California Fish and Game Code.[4] To be clear, the ACOE in evaluating the City's permit application will evaluate alternatives to the proposed project and will only issue a permit for the least environmentally damaging practicable alternative. This analysis will be conducted as part of the City's CWA permitting process and would only apply to future developers if the ACOE does not issue a site-wide permit to the City and instead considers permits on an as needed, project-by-project basis.

For clarity, the City recommends that the DEIS eliminate any statements suggesting further coordination by the City with the USACE, RWQCB, or other resource agencies regarding project-specific mitigation requirements or other permits/approvals during the City's land use review and approval process. As explained above, the City will either secure site-wide permits and will make compliance with those permits' applicable conditions of any development the City subsequently approves, or in the alternative, future property owners or developers will be responsible for identifying the need for, and securing, any necessary permits from those agencies.

Section 4 - Biological Resources

Section 4.1 - Wetlands and Other Waters

The DEIS notes that there are differences in the acreages presented within the DEIS and from the City's EIR, due to differences in how the site has been mapped. Some of the discrepancies and internal differences may be the result of different mapping techniques or GIS systems, such as modest differences in the size of the golf course or the acreage of various habitats that may be affected by reuse. However, the DEIS-stated acreages for jurisdictional and non-jurisdictional wetlands and other waters appear substantially different, and well beyond differences in mapping techniques or GIS systems. Moreover, the acreages of jurisdictional waters are inconsistent with the ACOE's jurisdictional determination.

On November 8, 2011, the ACOE issued a jurisdictional determination for 23.67 acres of jurisdictional wetlands and 12.83 acres of other jurisdictional waters, for a total of 36.50 acres of CWA jurisdictional waters on the site. In addition, H.T. Harvey & Associates has mapped an

[4] The DEIS repeatedly refers to the "CDFG Code", which presumably refers to the California Fish and Game Code.

0024-7

0024-7
Section 4.5.1.1 was revised to clarify the City's intent to obtain a site-wide Individual Permit and to indicate that in the absence of this permit, future property owners or developers will be responsible for identifying the need for and securing any necessary permits for impacts on wetlands and/or non-wetlands waters.

0024-8

0024-8
This section has been revised to reflect updated information regarding impacts to wetlands and other Waters of the U.S. In June of 2016, the USACE issued a Public Notice announcing their review of an application for an Individual Permit for the Area Plan to address Clean Water Act requirements related to the Project. Section 3.14 and 4.14 have been revised to present water resources data that is consistent with the data used in the USACE Public Notice for the Section 404 Permitting Process. Other sections of the FEIS have been updated for consistency with the Public Notice where appropriate.

additional 12.18 acres of non-jurisdictional waters on the site, which include the golf course ponds and canals. The City has applied to the ACOE to fill up to 11 acres of jurisdictional waters (up to 8.75 acres of wetlands and 2.25 acres of other jurisdictional waters). The actual amount of fill that may be attributable to the Area Plan may be less, in part, because the site remediation the Navy is responsible for under CERCLA will likely result in the loss of some jurisdictional waters, particularly in "Bunker City."

The DEIS reports 35.9 acres jurisdictional and 8.4 acres non-jurisdictional waters on the site, for a total of 44.3 acres of jurisdictional and non-jurisdictional waters (DEIS Table 3.14-1).[5] The DEIS concludes the Area Plan would impact/result in the permanent loss of 22 acres of jurisdictional and non-jurisdictional waters (DEIS, 4-52),[6] and reports that the Area Plan would result in the loss of 16.1 acres of jurisdictional wetlands and 6.1 acres of non-jurisdictional wetlands (DEIS, Tables 2-4 and 4.14-2, and DEIS, 4-174).

Please revise the DEIS to disclose the presence of 36.50 acres of jurisdictional waters and that the City has applied to the ACOE for a permit authorizing the loss of up to 11 acres of jurisdictional waters, including up to 8.75 acres of wetlands and 2.25 acres of other waters. Further, the DEIS should acknowledge that the Area Plan could cause the loss of fewer jurisdictional waters since the site remediation the Navy is responsible for under CERCLA (and which is not attributable to the Area Plan) may result in the permanent loss of jurisdictional wetlands and other waters.

Section 4.2 - California Tiger Salamander

The City concurs with the DEIS' conclusion (Table 3.5-3) that no suitable habitat for California tiger salamanders is present northwest of Willow Pass Road. The City would add that California tiger salamanders are thought to be absent from the area northwest of Willow Pass Road due to the absence of the species during intensive larval surveys conducted on several occasions since the 1980s (most recently in 2011) and during intensive upland surveys in selected areas as part of the Navy's planning for remediation. Those surveys, and their negative results, provide substantial evidence of the species' absence from the area northwest of Willow Pass Road.

Section 4.3 - Eagle Habitat

Tables ES-1 and 2-4 suggest that potential impacts to bald and golden eagles could occur due to "loss or disturbance of an active nest" and that "any future reuse would be required to avoid and minimize potential impacts to eagles and compensate for impacts to the species' habitat per the

[5] Elsewhere, the DEIS reports approximately 48.9 acres of wetlands and other waters on the site (DEIS, Table 3.5-2).

[6] According to Tables ES-2 and 2-4, the Area Plan would result in the loss of approximately 22.1 acres of wetlands and impact 8,408 linear feet of jurisdictional waters.

0024-8 Continued

0024-8 cont'd
The FEIS has been revised to present the avoidance and minimization measures, as well as fill estimates for the development related to the Area Plan, as described in the USACE Public Notice, published in June of 2016. Mitigation as discussed in the USACE Public Notice, has also been presented to demonstrate that any adverse impacts will be adequately mitigated through the Section 404 permitting process. The FEIS has also been revised to indicate that if the City does not attain a site-wide Individual Permit, that future developers or property owners will be responsible for identifying the need for and securing any necessary permits to fill waters of the US. These changes have been added to Sections 3.5, 3.14, 4.5, and 4.14, and Chapters 6 and 7.

0024-9

0024-9
Comment noted

protections afforded by the MBTA, BGEPA, and CDFG Codes."[7] As discussed in the DEIS, no known bald eagle nests are located in the vicinity of the site, and only one immature bald eagle has ever been detected on the site, in 1982 (DEIS, 4-59). A breeding pair of golden eagles nests along the eastern boundary of the site, in the Regional Park/Open Space Area that will be owned and controlled by the EBRPD (see Section 1.4). The EBRPD will be responsible for ensuring that its recreational or other activities do not disturb eagles or their nests, not the City as Table 7-1 suggests. Given the substantial distance, varied topography between the EDC Footprint and the eastern site boundary, development activities would not result in any golden eagle disturbance, nest destruction, or other action requiring a special permit under the Migratory Bird Treaty Act or Bald and Golden Eagle Protection Act.

Section 5 - Greenhouse Gas Emissions

The CRP Area Plan includes Book Three: Climate Action Plan and other mitigation measures to reduce greenhouse gas (GHG) emissions. (See, e.g., MMRP Mitigation Measure Air Quality 1 and Mitigation Measure Air Quality 3). The Climate Action Plan was reviewed by the Bay Area Air Quality Management District and is a "Qualified Greenhouse Gas Plan" under CEQA, and all future Area Plan development within the EDC Footprint will be subject to the Climate Action Plan and MMRP mitigation measures.

The discussion of both Alternatives in the DEIS concludes that each of them would meet target greenhouse gas (GHG) emissions and would not have a significant contribution to cumulative impacts related to GHG emissions (DEIS, 4-36, 39, 43). The City agrees with this conclusion.

However, the DEIS's cumulative impacts summary, in Table 5-2, indicates that new growth in the CRP Area is likely to contribute to a significant cumulative impact on GHG emissions. There is no analysis in the chapter supporting why "yes" was indicated in this table, and this conclusion seems to be inconsistent with the DEIS's other findings — namely, that neither Alternative would make a significant contribution to cumulative GHG emissions. Based on the analysis in the DEIS, we believe the conclusion in Table 5-2 should be "no."

Section 6 - Job and Population Projections

The DEIS provides job and population figures that are inconsistent both internally and with the City's EIR. As noted in Table 4.11-2 of the DEIS, the Transportation, Traffic, and Circulation section uses different figures from the other portions of the document.

Describing the predicted Area Plan-generated population, DEIS Tables 4.3-3 and 4.3-5 estimate a larger buildout population but fewer residential units and jobs than the CRP Area Plan EIR Addendum (see Table 1, below). The discussion of transportation, traffic, and circulation

[7] The discussion on DEIS, 4-59-4-60 does not identify any development, recreational, or other activity that is likely to trigger the need for any eagle-specific permitting or compensatory mitigation, and the City is not aware of any activity that would the need for an eagle permit.

0024-10

Table 7-1 in the FEIS has been revised to additionally indicate EBRPD's responsibility for ensuring that its activities avoid and minimize disturbance of golden eagles or nests or other species covered by the Migratory Bird Treaty Act and Bald and Golden Eagle Protection Act.

0024-11

Implementation of the Area Plan is not likely to contribute to a significant cumulative impact. The typographical error in Table 5-2 under GHG emissions was corrected to "no."

0024-12

As described in Section 4.1 of the Final EIS, in accordance with NEPA, the Navy conducted a separate evaluation of the potential environmental and socioeconomic impacts of reuse of the former NWS Concord as the reuse of the former Navy facility is a reasonably foreseeable consequence of the Navy's disposal action. This analysis was conducted independently of the City's analysis and is not meant to be consistent with the FEIR or the FEIR Addendum on all points. Updated demographic information, minor revisions to the proposed redevelopment plan that reflected further refinements to the plan, and the development of Alternative 2 and the No Action Alternative all resulted in differences in population and employment estimations between the FEIS and the FEIR and the FEIR Addendum.

Both the socioeconomic analysis in Section 4.3 and the traffic/transportation analysis in Section 4.11 rely on the most current data available at the time of writing. In the case of the socioeconomic analysis, the most up-to-date demographic data available for the City of Concord were from the U.S. Bureau of the Census's 2012 American Community Survey. For the traffic/transportation analysis the most up-to-date model available at the time of writing was the CCTA Countywide Travel Demand Model, updated in 2012, and the associated Technical Procedures, which were adopted by CCTA in early 2013. The forecasts used for the build-out conditions in the updated traffic model incorporated the latest land use and population projections developed by the Association of Bay Area Governments (ABAG), which were published in 2009. These projections included future development throughout the region through 2040, including estimations for the potential reuse of the former NWS Concord.

By utilizing the most current available data, and thus utilizing different data sources for each of these resource areas, some minor inconsistencies are present when comparing the two sections in terms of population and job creation estimates.

However, given the larger conceptual nature of the proposed redevelopment plan and the EIS, and the fact that these estimates differ by approximately only 7% - 11%, the overall impact of these differences on the EIS impact analysis is negligible. The level of magnitude of the potential socioeconomic and traffic/transportation impacts and the potential significance of these impacts are not affected by the differences caused by utilizing different data sources. Therefore, it was deemed appropriate to utilize the most current data possible for each resource area.

impacts in the Section 4.11 of the DEIS discloses different population estimates from those provided in Section 4.3, and those predictions are virtually the same as the CRP Area Plan EIR Addendum population estimates. It is clear that the numbers in Section 4.11 are based on those in the City's EIR, while the other sections of the EIS used information from the American Community Survey in 2012 to derive population (DEIS, 4-20) and from the U.S. Bureau of Economic Analysis in 2013 to derive employment (DEIS, 4-18). The DEIS, however, does not provide an explanation as to why it is acceptable to use these different figures or the effects the different population projections have on the environmental consequences.

Table 1: Summary of Population Estimates — DEIS and CRP Area Plan EIR Addendum

Topic	CRP EIR Addendum Table 1	DEIS Table 4.11-2 Transportation - Alternative 1	DEIS Tables 4.3-3 and 4.3-5 Alternative 1
Residential units	12,270	N/A	12,200
Population	28,800	28,861	32,387
Employment	26,380	26,531	24,594

Section 7 - Traffic Impacts

The DEIS reached some substantially different conclusions than the City's CEQA analysis regarding the Area Plan's potential effects on traffic and physical roadway improvements beyond those planned in the City's capital improvement program that are contrary to City policy actions. The differences in the traffic analysis are noted below, and conflicts with the City of Concord's traffic and transportation policies are also addressed. For the reasons discussed below, the EIS should not presume the City will implement any physical roadway improvements, and the physical improvements included in the DEIS should be eliminated from the final EIS.

Section 7.1 - Projected Levels of Service

Despite using population and employment numbers for CRP Area Plan buildout that are generally consistent with the CRP Area Plan EIR Addendum (as explained in Section 6), the DEIS reached substantially different conclusions regarding the level of service (LOS) at several intersections than the CRP Area Plan Final EIR Addendum. For instance, the DEIS concludes the northbound off-ramp from I-680 at Ygnacio Valley Road intersection will experience an LOS A under the Area Plan, compared to the CRP Area Plan Final EIR Addendum's conclusion that the intersection will experience LOS F conditions. Conversely, the DEIS concludes the Area Plan will cause the San Marco Boulevard — Willow Pass Road/SR 4 eastbound ramps intersection to experience LOS F conditions in the AM peak and PM peak travel periods, whereas the Reuse Plan Final EIR concludes the intersection will experience LOS C and E conditions during the AM peak and PM peak travel periods. There may be explanations for these differences, including the possibility that additional volume was forecast, physical

0024-12 cont'd
Comment and response continued from previous page.

0024-13
0024-12 Continued
The differences in the LOS results between the EIS and the Reuse Plan EIR and the Area Plan EIR Addendum are shown in a new appendix to the FEIS, H-2, and discussed in Section 4.11.1 of the FEIS, which discusses the methodology used to conduct the traffic analysis. The differences in LOS results can be largely attributed to differences in the baseline conditions and the models used to forecast the traffic on area roadways and highways over the approximately 7-year period between when the analysis was completed for the Reuse Plan EIR and when the analysis was completed for the EIS.

Specifically, the differences in the baseline conditions and the models include:

-New Traffic Counts. Baseline (existing) traffic conditions in the Reuse Plan EIR were based on traffic counts in 2007; baseline traffic conditions in the EIS were based on traffic counts in 2013. The 2013 counts represent an overall decrease in volumes at the analysis intersections when compared with the 2007 counts for the same intersections, with a few exceptions where the total intersection volumes increased in 2013. A table presenting the total volumes at intersections during the AM and PM peak hours in 2007 and 2013 has been included in Section 3.11.3 of the FEIS. The decrease in traffic volumes between 2007 and 2013 appears to be primarily related to the economic conditions in these time periods. The 2007 counts precede the economic downturn associated with the recession. While the recovery appears to have been complete by 2013 in other parts of the region, particularly, San Francisco and Silicon Valley, the 2013 counts used for the EIS indicate that the local economy had not fully returned to pre-recession conditions. Therefore, the lower traffic counts in 2013 appear related to fewer worker commutes due to lower employment. The discussion of the differences in the traffic counts between the Reuse Plan EIR and the EIS has been clarified in Section 3.11.3.

0024-13

-Updated Highway Capacity Manual Methodologies. For the roadway, freeway mainline, and ramp analysis, the EIR used the 2000 Highway Capacity Manual methodologies while the EIS used the 2010 Highway Capacity Manual methodologies.

-Updated CCTA Countywide Travel Model. The CCTA Countywide Travel Model was updated after the traffic analysis was completed for the Reuse Plan EIR. In the updated model, the horizon year for the forecasted growth projections is 2040,

whereas in the previous model, the horizon year was 2030. In addition, the updated model incorporates the new land use and socioeconomic assumptions for background growth for the forecast year, which are based on a more recent Association of Bay Area Governments (ABAG) growth projection that reflects the region's 2013 Sustainable Communities Strategy (SCS). This updated model represented the best tool available for forecasting traffic volumes at the county level at the time of the EIS analysis. Updates to the model reflect not only the changes in the inputs, such as land use and socio-economic data from ABAG and transportation networks from the most recent Countywide Transportation Plan, but also include revisions to the model processes that attempt to better represent travel behavior, specifically making the model more sensitive to transit-oriented development and pedestrian-oriented streetscapes.

-Roadway Improvements. At a few locations (6 intersections, 11 freeway mainline, and 4 ramps), the geometric assumptions differed between the EIR and EIS, which also contributed to the differences in the LOS results.

Overall, these differences between the EIR and EIS analysis resulted in several locations where the LOS improved primarily due to the decrease in either baseline (existing) counts and/or forecast future volumes. However, there are a few locations where the LOS degraded when compared with the EIR results. Generally, the LOS at locations to the west of the project site in Walnut Creek and portions of Concord improved due to lower future traffic volumes when compared with the 2030 volumes in the EIR. At a few locations to the east towards Pittsburg, the future volumes increased when compared with the 2030 volumes in the EIR. For example, notable increases in future volumes occurred at the intersections of Willow Pass Road/Evora Road (west) (AM), Willow Pass Road/SR-4 WB ramps (AM), Willow Pass Road/Evora Road (East CC) (AM), San Marco Boulevard/Willow Pass Road (AM and PM), and San Marco Boulevard/W. Leland Road (AM and PM), when compared with the EIR 2030 volumes. This increase can be attributed to roadway network improvements that provide access to the planned growth at the Pittsburg-Bay Point BART station with an estimated 1,800 additional households and 2,000 jobs, as reflected in the ABAG growth projections.

In response to the City comments regarding LOS results at specific locations:

-Intersection of the I-680 northbound off-ramp and Ygnacio Valley Road: The LOS A result was due to a reporting error. The LOS and v/c were analyzed correctly as shown in the LOS

calculations in the Transportation Impact Study (TIS) (see Appendix 2 in the TIS), but were not reported correctly in Table 20 of the TIS. The correct result is LOS F with 1.00 v/c during both the AM and PM peak hours for Alternative 1 and 2. The correct result for the No Action Alternative is LOS F with 1.00 v/c during the AM peak hour and LOS F with 1.02 v/c during the PM peak hour. A second reporting error at the intersection of San Marco Boulevard and West Leland Road was also found. The LOS and v/c were analyzed correctly as shown in the LOS calculations in the TIS (see Appendix 2 in the TIS) but were not reported correctly in Table 20 of the TIS. The correct result for Alternative 1 is LOS D with 0.89 v/c in the AM peak hour and LOS D with 0.85 v/c in the PM peak hour. The correct result for Alternative 2 is LOS D with 0.87 v/c in the AM peak hour and LOS D with 0.89 v/c in the PM peak hour. The correct result for the No Action alternative is LOS D with 0.84 v/c in the AM peak hour and LOS C with 0.72 v/c in the PM peak hour. These results have been updated in Table 4.11-9 in the FEIS, with appropriate text edits to reflect the corrected results. In addition, the TIS has been included as Appendix H to the FEIS; the results were updated in Table 20.

-Intersection of San Marco Boulevard and Willow Pass Road/SR 4 eastbound ramps: The total baseline count in 2013 was higher than in 2007 by 20 percent in the AM and 21 percent in the PM, while the future volumes were also higher by 33 percent in the AM and 37 percent in the PM. These increases in the future volumes can be attributed to the future roadway connection of Leland Road to Avila Road, which results in increased volumes on San Marco Boulevard, as well as the planned Priority Development Areas around the Pittsburg-Bay Point BART station from the Plan Bay Area. Thus, the LOS at this location degraded to LOS F, when compared to the EIR.

geometry was changed, or the LOS thresholds were changed. However, the DEIS does not explain the substantial differences in the anticipated levels of service.

Section 7.2 - Physical Roadway Improvements

DEIS Tables 4-11.9 through 4-11.12 list physical traffic improvements the DEIS expects the City will implement at specific locations to mitigate traffic impacts, even though the "city plans to mitigate transportation impacts through implementation of design standards in the Action Plan and other TDM [transportation demand management] strategies to reduce VMT [vehicle miles traveled]..." The DEIS acknowledges the City policy presented in the MMRP (see, e.g., measures Transportation 3 and 4) to undertake TDM to mitigate transportation impacts, rather than capacity-increasing physical improvements. Through the MMRP, the City also committed to monitoring the roadway network to understand how TDM was performing as mitigation. This approach is described in the FEIR on page 4-114: "as a policy matter, the City will implement TDM measures rather than roadway widening, as wider roads in residential neighborhoods and urban locations would encourage the use of automobile travel and discourage walking by increasing exposure of pedestrians during crossings."

The City adopted a Statement of Overriding Considerations in conjunction with certification of the Reuse Plan FEIR. The Statement of Overriding Considerations identifies significant and unavoidable impacts to transportation (freeway segments, freeway ramps, roadway segments, intersections, and the performance of regional routes), but found that these impacts were outweighed by the benefits to the community of the Preferred Alternative.[8]

Despite these past City policy actions, the DEIS includes specific capacity-increasing physical traffic improvements. For example, DEIS Table 7-1 states that the City of Concord will implement a mitigation measure (Mitigation Measure TT-1) to "[e]nsure that roadway or traffic-flow improvements are incorporated as needed into development proposals to mitigate the impacts of the increase in traffic volume on level of service (LOS). These improvements would be coordinated with appropriate local and regional traffic and transportation planning agencies, **and may include widening roadways to provide dedicated turning lanes, widening roadways to provide dedicated receiving lanes for through traffic, and other similar projects**" (emphasis added). Table 7-1 assumes the City will take steps to place these projects on "improvement program lists and/or identif[y] needed mitigation measures on final permits and authorizations as a condition of approval by the city."

"Mitigation Measure TT-1" should be removed from Table 7-1. The mitigation measure columns in Tables 4-11.9 through 4-11.12 should also be removed from the final EIS.

[8] The Concentration and Conservation alternative defined in the Reuse Plan FEIR.

0024-14

0024-14
As stated in the City of Concord's comment, the EIS acknowledges the City of Concord policy presented in the 2010 Mitigation Monitoring and Reporting Program (MMRP) to undertake TDM strategies to reduce vehicle miles traveled (VMT) to mitigate transportation impacts, rather than capacity-increasing physical improvements. Section 4.11 of the FEIS has been updated to include additional language describing the City of Concord's approach to TDM, the associated planning process, the monitoring process planned over time, and the coordination that will occur with the appropriate jurisdictions.

As originally stated in the City of Concord's Response to Comments on the August 2009 Draft Revised Environmental Impact Report (2010 RTC) it remains too early to identify specific physical or operational traffic mitigation measures at individual locations for implementation since the project is still in an early planning phase. As such, Section 4.11 of the FEIS and Tables 4-11.9 through 4-11.12 identify capacity-increasing physical improvement measures that may be considered by the City of Concord if future conditions warrant. The mitigation language has been modified in the FEIS to clarify that intent without removing the mitigation measure column as requested by the comment. The mitigation measure headings of Tables 4-11.9 through 4-11.12 have been revised to "Physical Improvement Measures that May Be Considered in Accordance with the Adopted MMRP." Likewise, Table 7-1 has been revised to incorporate additional detail on TDM strategies and the coordination with affected jurisdictions that will be required as part of the adopted MMRP process addressing physical roadway improvements. The City of Concord may consider physical improvement measures such as those identified in the EIS after more detailed planning studies, design and engineering are conducted in conjunction with the master developer, and coordination with affected jurisdictions is completed. This approach is in alignment with the transportation actions outlined in the MMRP.

Future coordination with affected jurisdictions will be required to reach agreement on specific capacity-increasing physical improvements. As stated in the 2010 Concord Community Reuse Plan Final Environmental Impact Report and the 2010 MMRP, the City of Concord has committed to coordinate with "affected jurisdictions prior to the approval of a specific development with the goal of reaching agreement on the appropriate mitigation measures to address impacts in the respective agencies' jurisdiction. The City of Concord will work collaboratively with affected jurisdictions to identify specific performance criteria to mitigate the impact. Mitigation measures may include capacity

increases, Transportation Demand Management (TDM) measures, arterial traffic management tools, and adaptive timing technology upgrades." The City of Concord will confirm required mitigation measures and identify specific performance criteria with affected jurisdictions each time the City of Concord approves a development plan or discretionary entitlement (MMRP 2010).

The City appreciates the Navy's consideration of its comments in the preparation of its EIS, and will continue to work with the Navy to convey the NWS Concord from federal ownership.

Sincerely,

Michael Wright
Executive Director
Local Reuse Authority

NWS Concord EIS

Comment Sheet

Thank you for attending today's open house public meeting. You are invited and encouraged to review and comment on the Draft Environmental Impact Statement. Your comments will be incorporated into the public record and will be responded to in the Final EIS.

The Draft EIS is available for viewing at the following locations:

- **Concord Library,** 2900 Salvio Street, Concord, CA 94519
- **Pittsburg Library,** 80 Power Avenue, Pittsburg, CA 94565
- **Pleasant Hill Library,** 1750 Oak Park Boulevard, Pleasant Hill, CA 94523

An electronic version of the Draft EIS can be viewed or downloaded at the following website: *http://www.bracpmo.navy.mil.*

Written comments may be submitted in one of the following four ways:

(1) fill out this comment sheet and drop it into a comment box before leaving today's meeting
(2) mail your comments using this form (see address below)
(3) email your comments to *erica.spinelli@navy.mil*
(4) fax comments to (619) 532-0995, ATTN: Concord EIS

All comments must be postmarked, faxed or emailed by midnight on November 25, 2014.

Review of Quality of Life & Development plans do not address "Green Building"
During initial town Hall Meeting Green Building was placed as a high priority.
The City must require all commercial construction be Green and that new housing Developements use solar power and be a Requirment for Developers to receive approval.

0025-1
The purpose of the proposed action is to dispose of surplus property at the former NWS Concord for subsequent reuse in a manner consistent with the policies adopted by the City of Concord during reuse planning that took place between 2008 and 2012. The need for the proposed action is to provide the local community the opportunity for economic development and job creation. As mentioned in the EIS, as the LRA, the City of Concord is responsible for the implementation of its reuse plan. The future developer or owner of the property will be responsible for acquiring applicable building permits, development approvals, and environmental permits for development of the property.

Why isn't the Navy making a formal presentation? Why isn't the Navy overlapping the City of Concord's certified programmatic EIR over the Navy's draft EIS? I request that such a presentation be made during the public comment period.

The Navy finds that the open house format (as utilized for the November 2014 public meeting) effectively allows the Navy to 1) share information about our NEPA EIS analysis and 2) engage with members of the public at individual poster stations to address questions and hear feedback. Alternative 1 in the Navy's EIS includes reuse of the property in a manner consistent with the City of Concord's Area Plan, for which the City certified an EIR. The Navy considered the City's certified EIR and EIR addendum in its independent NEPA analysis documented in the EIS. As relevant and appropriate, the FEIS identifies and explains substantive differences between the EIR and the EIS.

Ms. Erica Spinelli
Department of the Navy (DOD)
1455 Frazee Road, Suite 900
San Diego, CA 92108

Dear Ms. Spinelli:

Disposal and Reuse of the Former NWS Seal Beach, Detachment Concord, Concord, CA – Draft Environmental Impact Statement (DEIS)

Thank you for continuing to include the California Department of Transportation (Caltrans) in the environmental review process for the project referenced above. We have reviewed the DEIS and have the following comments to offer.

Forecasting
Page ES-3 and ES-5 states that Alternative 1 and 2 contain 30% mixed-use and 70% conservation of parks or recreation land uses. Page ES-19 shows the proposed Alternative 1 and 2 projects 203 and 205 have 229,301 daily trips respectively to the new and existing road network. Page 4-128 / Table 4.11-5 indicates 252,760 daily person trips under Alternative 1 versus 287,374 daily person trips under Alternative 2. Based upon information mentioned above, Caltrans believes either alternative 1 or 2 would likely cause significant traffic impacts upon the surrounding Interstate (I-) 680, State Route (SR) 4, and SR 242. Please investigate and document ways to mitigate the impacts your project will have on the State Highway System (SHS).

Caltrans recommends the traffic impact study should include AM and PM turning movement traffic per study intersection, queuing length, and other traffic operation parameters under Existing, Project Only, 2035 Cumulative and 2035+Project Conditions.

Traffic Operations
Please include in your analysis of project trips traveling to the west and south of I-680/ SR 24 interchange, and to the east of SR 4. A detailed analysis / evaluation of impacts are needed in order to discuss respective mitigation or fair share for the SHS.

0033-1
The Transportation Impact Study (TIS) for the Navy's 2014 DEIS is included as Appendix H of the FEIS. The TIS examines the current transportation network and addresses the environmental effects on the future circulation system from implementing the three alternatives of the proposed action (Action) for the former NWS Concord. The Caltrans comments are primarily technical in nature and the TIS provides the technical background for the EIS transportation analysis.

This comment requests an analysis of the State Highway System (SHS) and documentation of associated mitigation in the EIS. The analysis presented in the EIS and in TIS Sections 3.4.3 and 3.4.4 covered impacts on the SHS, specifically, 12 mainline segments—6 segments on I-680, 1 segment on SR 242, and 5 segments on SR 4—as well as 21 ramps - 3 ramps on I-680, 3 ramps on SR 242, and 15 ramps on SR 4. The analysis found impacts at 4 freeway segments and 16 ramps; however, many of these locations would experience substandard operations under the No Action Alternative as shown in Tables 4-11.1 and 4.11-12 of the FEIS. To mitigate these impacts on the SHS, TDM programs have been adopted through an amendment to the Concord 2030 General Plan that will reduce the use of automobiles and lessen traffic impacts. As stated in the MMRP, the City of Concord will coordinate with affected jurisdictions on specific mitigation measures prior to the approval of a development plan or discretionary entitlement. The goal of coordination is to address the traffic impacts in the respective agencies' jurisdiction through appropriate mitigation measures, which may include TDM measures and physical roadway improvements that increase capacity. In addition, the City of Concord will require developers to contribute to the TRANSPAC Subregional Transportation Mitigation Fee Program to fund transportation improvements.

0033-1

Table 7-1 has been revised to incorporate additional detail on TDM strategies and the coordination with affected jurisdictions that will be required as part of the City of Concord's adopted MMRP process addressing physical roadway improvements. The DEIS references the City of Concord's traffic impact fee in accordance with the TRANSPAC Subregional Transportation Mitigation Fee Program in Section 4.11.2 and Table 7-1.

0033-2

0033-3

0033-2
This comment is related to turning movement traffic. The TIS provides intersection turning movements for the AM and PM peak for Existing, 2040 No Action, 2040 Alternative 1 project, and

2040 Alternative 2 project. Turning movements were not provided for Project-only trips due to the nature of the approach, which was not additive. Rather, the updated CCTA Countywide Model was used to capture not only the trips generated by the Project, but also the interaction between the Project and its local context by capturing trips from adjacent land uses and travel patterns that reflect the capacity of the roadway. Intersection lane configurations and turning movement diagrams are provided in Appendix 1 of the TIS.

Queue lengths were not reported since the performance metric to determine significance was level of service (LOS). The length of the ramps was input as part of the analysis. Given the programmatic nature of the Proposed Action and long build-out horizon year, detailed queue analysis, which is more appropriate for project-level analysis, was not conducted as part of the EIS. Freeway ramp analysis worksheets are provided in Appendix 4 of the TIS.

0033-3
This comment is related to trip distribution. The trip distribution as shown in Table 18 of the TIS shows where trips are going to and coming from based on the model during the AM and PM peak hours, which are the time periods for which the analyses were conducted. The trip distribution includes trips traveling to the west and south of the I-680/SR 24 interchange as well as to the east of SR 4. The project trip generation is also shown in Figure 4.11-2 of the FEIS. This trip distribution shows vehicle trips on the roadway network but does not include the trips to employment centers in the west or south that are accessed via transit, specifically, BART.

Specific mitigation measures and fair share contributions will be determined as part of specific project-level analyses. As indicated in the response to comment 0024-14, FEIS Table 7-1 has been revised to incorporate additional detail on TDM strategies and the coordination with affected jurisdictions that will be required as part of the City of Concord's adopted MMRP process addressing physical roadway improvements. In the 2010 MMRP, the City of Concord committed to conducting a Nexus Study, required pursuant to the Mitigation Fee Act, for the entire former NWS Concord site to establish an equitable traffic impact-fee rate for each land use category to ensure that future development projects will contribute a fair share of the unfunded costs of planned improvements and mitigation measures. In the MMRP, the City of Concord also committed to requiring future developers to contribute a traffic impact fee in accordance with the

TRANSPAC Subregional Transportation Mitigation Fee Program requirements of the Central County Action Plan for Routes of Regional Significance. The FEIS references the City of Concord's Nexus Study and the traffic impact fee in accordance with the TRANSPAC Subregional Transportation Mitigation Fee Program in Section 4.11.2 and Table 7-1.

On page 3-151, Table 3.11-2 Study Locations, the Ygnacio Valley corridor should be included in the DEIS, specifically, near / I-680 at the SR 24 / I-680 interchange. There is currently no indication of project trip generation directed towards employment centers in the west or south. Note that in Figure 4.11-2 Trip Distribution, it does not indicate south or west project trip generation. Delay Index is not sufficient for use for the SHS or on adjacent intersections.

With over 200,000 project trips generated per day (Alternative 1 & 2), all ramps should be included in Traffic Impact Study (TIS). Low capacity facilities should be included since a low demand could still have an impact such as SR 242 / Grant Street and Olivera Road ramps. Local intersections directly impacting operations of off-ramps with the risk of potential back-up onto mainline need to be included in the TIS. Also, mainline segments to be included are I-680 from SR 24 to SR 4, SR 4 from I-680 to the Railroad Interchange, and the SR 242 corridor.

P 3-157, Table 3.11-4 Traffic Volumes, please use Caltrans census volumes received from the Caltrans Census Unit for mainline and ramps. Volumes used on SR 4 seem very high (i.e. WB at 8,733 vehicles per hour). Please provide tables and calculations used in analysis. Please explain how your analysis was conducted for Table 3.11-9 (level-of-service). For more information on Caltrans Census volumes please contact Ron Kyutoku, Branch Chief at 510-286-4640.

Should you have any questions regarding this letter, please call Keith Wayne of my staff at 510-286-5737 or keith_wayne@dot.ca.gov.

Sincerely,

ERIK ALM, AICP
District Branch Chief
Local Development - Intergovernmental Review

0033-4

0033-5

0033-6

0033-4
This comment is related to study locations, trip distribution, and the Delay Index measurement. Study locations were identified based on the comments received from the scoping meeting as well as findings from previous studies performed for the City of Concord for this site. The analysis included the following intersections on Ygnacio Valley Road: I-680 NB Off- Ramp, Bancroft Road-Walnut Ave, Oak Grove Road, and Ayers Road. The intersection of Ygnacio Valley Road at the I-680 NB Off-Ramp is at the SR 24/I-680 interchange and was selected as a critical intersection in this area based on the findings from previous studies for the former NWS Concord site. A detailed description of the selection process is provided in Section 3.2 of the TIS and Section 3.11.2 of the FEIS.

The project trip generation as shown in the Final Figure 4.11-2 shows smaller percentages of project vehicle trips to and from the south and west (to and from the City of Concord and to and from Central Contra Costa County). This trip distribution shows vehicle trips on the roadway network but does not include the trips to employment centers in the west or south that are accessed via transit, specifically, BART. Table 18 in the TIS provides additional detail on trip distribution and shows where vehicle trips would go during the AM and PM peak hours, which are the time periods for which the analyses were conducted.

The Delay Index was calculated per the Multimodal Transportation Service Objectives (MTSO) from the adopted Central and East County Action Plans (2009) for the freeways that are Routes of Regional Significance. Therefore, the Delay Index is applied for the purposes of analyzing the MTSOs. A detailed description of MTSOs and the Delay Index is provided in Section 3.4.5 of the TIS. In addition, the Highway Capacity Manual methodologies were used for the freeway mainline and ramps as well as the intersections to determine the level of service (LOS), per Caltrans traffic impact study guidelines.

0033-5
This comment is related to trip generation and the inclusion of ramps and mainline segments in the TIS. The EIS and TIS covered 21 ramps on I-680, SR 242, and SR 4. For local intersections that directly impact operations of off-ramps, the analysis intersections were selected based on the previous studies that have been conducted for the former NWS Concord site. The selection of ramp locations was based on a subset of the 40 ramps analyzed in the 2010 Final Reuse Plan EIR, which were found to exceed performance thresholds. Low capacity

facilities where impacts were not identified in the 2010 Final Reuse Plan EIR were screened out through this selection process. Mainline segments included I-680 from south of Monument Boulevard to SR 4, SR 242, and SR 4 from SR 242 to east of Railroad Avenue. A detailed description of the selection process is provided in Section 3.2 of the TIS and Section 3.11.2 of the EIS. Please see responses to comments 0033-1 and 0033-4 for additional information regarding impacts on the State Highway System and study locations.

0033-6
This comment is related to traffic volume sources and the analysis provided in the TIS. The freeway counts were compiled from a number of sources, including the SR 4/SR242 Ramp Metering Study as well as Caltrans' Performance Measurement System (PeMS) data, as documented in the TIS Section 3.3. Further documentation of the count sources and assumptions used to develop the peak hour volumes are provided in the TIS footnotes in Section 3.3. At the time of the analysis, this was the best available data from Caltrans. The freeway volumes and ramp volumes used for the ramp analysis are provided in Appendix 4 of the TIS. The methodology for calculating the freeway mainline LOS shown in the FEIS Table 3.11-9 is described in Section 3.4.3 of the TIS.

Subject: Disposal and Reuse of the Naval Weapons Station Seal Beach Detachment Concord
SCH#: 2013032045

Dear Erica Spinelli:

The State Clearinghouse submitted the above named Draft EIS to selected state agencies for review. The review period closed on November 24, 2014, and no state agencies submitted comments by that date. This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act.

Please call the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. If you have a question about the above-named project, please refer to the ten-digit State Clearinghouse number when contacting this office.

Sincerely,

Scott Morgan
Director, State Clearinghouse

SCH# 2013032045
Project Title Disposal and Reuse of the Naval Weapons Station Seal Beach Detachment Concord
Lead Agency U.S. Navy

Type EIS Draft EIS

Description This Draft EIS presents an analysis of the Navy's disposal of surplus property at the former NWS Seal Beach, Detachment Concord, in the City of Concord, Contra Costa County, CA, and the subsequent redevelopment of the property by the local community. The Navy has declared approx. 5,028 acres of property at the former NWS Concord to be surplus to the needs of the federal government. The EIS examines the potential human and natural environmental consequences of the proposed action and any impacts associated with the reasonably foreseeable reuse of the property. Two redevelopment alternatives and a No Action Alternative were considered. Alternative 1 (Preferred Alternative) is the disposal of the surplus property and reused in accordance with the Concord Reuse Project Area Plan as adopted by the City of Concord. Alternative 2 (Intensified Reuse) represents a higher intensity of use overall. The No Action Alternative is the retention of the surplus property in caretaker status.

BILLING CODE 3810–FF–P

DEPARTMENT OF DEFENSE

Department of the Navy

Notice of Public Hearing for the Draft Environmental Impact Statement for the Disposal and Reuse of Former Naval Weapons Station Seal Beach, Detachment Concord, Concord, California

AGENCY: Department of the Navy, DoD.

ACTION: Notice.

SUMMARY: Pursuant to the National Environmental Policy Act (NEPA) of 1969 (Pub. L. 91–190, 42 United States Code [U.S.C.] 4321–4347), as implemented by the Council on Environmental Quality Regulations implementing NEPA (40 Code of Federal Regulations [CFR] parts 1500–1508), the Department of the Navy (DoN) has prepared and filed the Draft Environmental Impact Statement (EIS) to evaluate the potential environmental consequences associated with the disposal of the former Naval Weapons Station Seal Beach, Detachment Concord, Concord, California (NWS Concord), and its subsequent reuse by the local community. The DoN is initiating a 45-day public comment period to provide the community an opportunity to comment on the Draft EIS. Federal, state, and local elected officials and agencies and the public are encouraged to provide written comments. A public meeting will also be held to provide information and receive written comments on the Draft EIS.

Dates and Addresses: An open house public meeting will be held at the location listed below and will allow individuals to review and comment on the information presented in the Draft EIS. DoN representatives will be available during the open house to clarify information presented in the Draft EIS as necessary. There will not be a formal presentation.

Thursday, November 13, 2014 (4:00 p.m. to 8:00 p.m.), Concord Senior Citizens Center (Wisteria Room), 2727 Parkside Circle, Concord, California 94519.

FOR FURTHER INFORMATION CONTACT: Director, NAVFAC BRAC PMO West, Attn: Ms. Erica Spinelli, NEPA Project Manager, 1455 Frazee Road, Suite 900, San Diego, California 92108–4310, telephone: 619–532–0980, fax: 619–532–0995; email: *erica.spinelli@navy.mil.*

For more information on the NWS Concord EIS, visit the Navy BRAC PMO Web site (*http://www.bracpmo.navy.mil/*).

SUPPLEMENTARY INFORMATION: The DoN has prepared the Draft EIS for the Disposal and Reuse of the Former NWS Concord in accordance with the requirements of NEPA (42 U.S.C. Sections 4321–4347) and its implementing regulations (40 CFR Parts 1500–1508). A Notice of Intent (NOI) to prepare this Draft EIS was published in the **Federal Register** on March 14, 2013 (**Federal Register**, Vol. 78, No. 50/Friday, March 14, 2013/Notices). The DoN is the lead agency for the proposed action, with the U.S. Army Corps of Engineers serving as a cooperating agency for the preparation of this EIS.

The DoN closed the former NWS Concord on September 30, 2008, in accordance with Public Law (Pub. L.) 101–510, the Defense Base Closure and Realignment Act (DBCRA) of 1990, as amended in 2005. The DBCRA exempts the decision-making process of the Defense Base Closure and Realignment Commission from the requirements of NEPA. The DBCRA also relieves the DoN from the NEPA requirements to consider the need for closing, realigning, or transferring functions and from looking at alternative installations to close or realign. However, in accordance with NEPA, before disposing of any real property, the DoN must analyze the environmental effects of the disposal.

The purpose of the proposed action is to dispose of surplus property at the former NWS Concord for subsequent reuse in a manner consistent with the policies adopted by the City of Concord during reuse planning that took place between 2008 and 2012. The need for the proposed action is to provide the local community the opportunity for economic development and job creation.

The Draft EIS has considered two redevelopment alternatives for the disposal and reuse of NWS Concord. Both redevelopment alternatives would be generally consistent with the policies developed by the City of Concord during the reuse planning process that took place between 2008 and 2012. Both alternatives focus on the preservation of a significant amount of open space and conservation areas, and sustainable development characterized by walkable neighborhoods, transit-oriented development, and "complete streets" that balance multiple types of transportation. Under both alternatives, most installation facilities would be demolished, and the western side of the property would be developed as a series of mixed-use "development districts," with a higher concentration of development at the north end, near State Route 4 and the North Concord/Martinez Bay Area Rapid Transit Station. Redevelopment under either alternative would include parks and open spaces, best management practices for stormwater management, and green and sustainable design and planning principles. Full build-out under either alternative would be implemented over a 25-year period. A No Action alternative was also considered, as required by NEPA and to provide a point of comparison for assessing impacts of the redevelopment alternatives.

Alternative 1 includes the disposal of the former NWS Concord by the DoN and its reuse in a manner consistent with the adopted Concord Reuse Project (CRP) Area Plan. This alternative has been identified as the Preferred Alternative by the DoN. Under this alternative, redevelopment of approximately 2,500 acres of the former installation property would take place and would include a mix of land use types and densities. This alternative would also result in the preservation of a significant area of open space and conservation areas. The redevelopment would include approximately 6.1 million square feet of commercial floor space and up to 12,272 residential housing units.

Alternative 2 provides for the disposal of the former installation property by the DoN and its reuse in a manner similar to the Area Plan but with a higher density of residential development than under Alternative 1 and within a smaller footprint. Under this alternative, redevelopment of approximately 2,200 acres of the former installation property with a mix of land use types and densities would take place. This alternative would also include the preservation of a significant amount of open space and conservation areas. The alternative calls for approximately 6.1 million square feet of

commercial building space and up to 15,872 residential housing units. Alternative 2 as presented in the Draft EIS is different from Alternative 2 as presented in the NOI circulated during the public scoping period in March and April 2013. Alternative 2 was revised by the DoN in response to comments received during the public scoping period to be more consistent with the land use planning policies adopted by the City of Concord as well as known and foreseeable market conditions. Comments on Alternative 2 received during the scoping period addressed the smaller area designated for conservation and open space in this alternative, as well as concerns regarding higher levels of traffic, noise, and air impacts. Accordingly, the revised Alternative 2 is more similar to the adopted policies of the City of Concord as expressed in the CRP Area Plan, reflecting a similar but slightly smaller development footprint and representing a realistic reuse scenario.

The No Action Alternative is also analyzed in the Draft EIS, as required by NEPA. Under this alternative, NWS Concord would be retained by the U.S. government in caretaker status. No reuse or redevelopment would occur.

The Draft EIS addresses potential environmental impacts under each alternative associated with land use and zoning; socioeconomics and environmental justice; air quality and greenhouse gases; biological resources; cultural resources; topography, geology, and soils; hazards and hazardous substances; noise; public services; transportation, traffic, and circulation; utilities and infrastructure; visual resources and aesthetics; and water resources. The analysis addresses direct and indirect impacts, and accounts for cumulative impacts from other foreseeable federal, state, or local activities at and around the former NWS Concord property. The DoN conducted a scoping process to identify community concerns and local issues that should be addressed in the EIS. The DoN considered the comments provided, which identified specific issues or topics of environmental concern, in determining the scope of the EIS. The Draft EIS identifies significant adverse impacts to air quality and traffic, and significant beneficial impacts to socioeconomics and public services. The Draft EIS has been distributed to various federal, state, and local agencies, as well as other interested individuals and organizations.

Federal, state, and local agencies, as well as interested members of the public, are invited and encouraged to review and comment on the Draft EIS. The Draft EIS is available for viewing at the following locations:

Concord Library, 2900 Salvio Street, Concord, CA 94519

Pittsburg Library, 80 Power Avenue, Pittsburg, CA 94565

Pleasant Hill Library, 1750 Oak Park Boulevard, Pleasant Hill, CA 94523

An electronic version of the Draft EIS can be viewed or downloaded at the following Web site: *http://www.bracpmo.navy.mil.* A limited number of hard copies are available by contacting the DoN's Base Realignment and Closure Program Management Office (BRAC PMO) at the address in this notice.

Comments can be made in the following ways: (1) Written statements can be submitted to a DoN representative at the public meeting; (2) written comments can be mailed to Director, NAVFAC BRAC PMO West, Attn: Ms. Erica Spinelli, NEPA Project Manager, 1455 Frazee Road, Suite 900, San Diego, California 92108–4310; (3) written comments can be emailed to *erica.spinelli@navy.mil;* or (4) comments can be faxed to 619–532–0995, Attn: Ms. Erica Spinelli. Comments may be submitted without attending the public meeting. All comments postmarked or emailed no later than midnight, November 25, 2014, will become part of the public record and will be responded to in the Final EIS.

Requests for special assistance, sign language interpretation for the hearing impaired, language interpreters, or other auxiliary aids for the scheduled public meeting must be sent by mail or email to Ms. Jone Guerin, Ecology and Environment, Inc., 368 Pleasant View Drive, Lancaster, NY 14086, telephone: 716–684–8060, email: *jguerin@ene.com* no later than October 30, 2014.

Dated: October 6, 2014.

N.A. Hagerty-Ford,

Commander, Office of the Judge Advocate General, U.S. Navy, Federal Register Liaison Officer.

AGENCY: Office of Fossil Energy, Department of Energy.

ACTION: Notice of orders.

SUMMARY: The Office of Fossil Energy (FE) of the Department of Energy gives

are to respond, including through the use of appropriate automated electronic, mechanical, or other technological collection techniques or other forms of information technology, e.g., permitting electronic submission of responses. In particular, EPA is requesting comments from very small businesses (those that employ less than 25) on examples of specific additional efforts that EPA could make to reduce the paperwork burden for very small businesses affected by this collection.

II. What information collection activity or ICR does this action apply to?

Title: PCBs, Consolidated Reporting and Record Keeping Requirements.

ICR number: EPA ICR No. 1446.11.

OMB control number: OMB Control No. 2070–0112.

ICR status: This ICR is currently scheduled to expire on August 31, 2015. An Agency may not conduct or sponsor, and a person is not required to respond to, a collection of information, unless it displays a currently valid OMB control number. The OMB control numbers for EPA's regulations in title 40 of the Code of Federal Regulations (CFR), after appearing in the **Federal Register** when approved, are listed in 40 CFR part 9, are displayed either by publication in the **Federal Register** or by other appropriate means, such as on the related collection instrument or form, if applicable. The display of OMB control numbers for certain EPA regulations is consolidated in 40 CFR part 9.

Abstract: Section 6(e)(1) of the Toxic Substances Control Act (TSCA), 15 USC 2605(e), directs EPA to regulate the marking and disposal of polychlorinated biphenyls (PCBs). Section 6(e)(2) bans the manufacturing, processing, distribution in commerce, and use of PCBs in other than a totally enclosed manner. Section 6(e)(3) establishes a process for obtaining exemptions from the prohibitions on the manufacture, processing, and distribution in commerce of PCBs. Since 1978, EPA has promulgated numerous rules addressing all aspects of the life cycle of PCBs as required by the statute. The regulations are intended to prevent the improper handling and disposal of PCBs and to minimize the exposure of human beings or the environment to PCBs. These regulations have been codified in the various subparts of 40 CFR 761. There are approximately 100 specific reporting, third-party reporting, and recordkeeping requirements covered by 40 CFR 761.

To meet its statutory obligations to regulate PCBs, EPA must obtain sufficient information to conclude that specified activities do not result in an unreasonable risk of injury to health or the environment. EPA uses the information collected under the 40 CFR 761 requirements to ensure that PCBs are managed in an environmentally safe manner and that activities are being conducted in compliance with the PCB regulations. The information collected by these requirements will update the Agency's knowledge of ongoing PCB activities, ensure that individuals using or disposing of PCBs are held accountable for their activities, and demonstrate compliance with the PCB regulations. Specific uses of the information collected include determining the efficacy of a disposal technology; evaluating exemption requests and exclusion notices; targeting compliance inspections; and ensuring adequate storage capacity for PCB waste. This collection addresses the several information reporting requirements found in the PCB regulations.

Responses to the collection of information are mandatory (see 40 CFR part 761). Respondents may claim all or part of a response confidential. EPA will disclose information that is covered by a claim of confidentiality only to the extent permitted by, and in accordance with, the procedures in TSCA section 14 and 40 CFR part 2.

Burden statement: The annual public reporting and recordkeeping burden for this collection of information is estimated to average 1.36 hours per response. Burden is defined in 5 CFR 1320.3(b).

The ICR, which is available in the docket along with other related materials, provides a detailed explanation of the collection activities and the burden estimate that is only briefly summarized here:

Respondents/Affected Entities: Entities potentially affected by this ICR are persons who currently possess PCB items, PCB-contaminated equipment, or other PCB waste.

Estimated total number of potential respondents: 548,298.

Frequency of response: On occasion.

Estimated total average number of responses for each respondent: 1.0.

Estimated total annual burden hours: 745,926 hours.

Estimated total annual costs: $29,778,544. This includes an estimated burden cost of $29,778,544 and an estimated cost of $0 for capital investment or maintenance and operational costs.

III. Are there changes in the estimates from the last approval?

There is an increase of 60,591 hours in the total estimated respondent burden compared with that identified in the ICR currently approved by OMB. This increase reflects EPA's revisions to the estimated total number of respondents, resulting from new data gathered for this ICR effort as well as another recent PCB regulatory analysis, plus updated Agency data regarding total numbers of regulated entities. The ICR supporting statement provides a detailed analysis of the change in burden estimate. This change is an adjustment.

IV. What is the next step in the process for this ICR?

EPA will consider the comments received and amend the ICR as appropriate. The final ICR package will then be submitted to OMB for review and approval pursuant to 5 CFR 1320.12. EPA will issue another **Federal Register** document pursuant to 5 CFR 1320.5(a)(1)(iv) to announce the submission of the ICR to OMB and the opportunity to submit additional comments to OMB. If you have any questions about this ICR or the approval process, please contact the technical person listed under **FOR FURTHER INFORMATION CONTACT**.

Authority: 44 U.S.C. 3501 *et. seq.*

Dated: October 1, 2014.

James Jones,

Assistant Administrator, Office of Chemical Safety and Pollution Prevention.

Cancellation of Pesticides for Non-Payment of Year 2014 Registration Maintenance Fees; Summary of Orders Issued

AGENCY: Environmental Protection Agency (EPA).

ACTION: Notice.

SUMMARY: Under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), the payment of an annual maintenance fee is required to keep pesticide registrations in effect. The fee due last January 15, 2014, has gone unpaid for 199 registrations. If the fee is not paid, the EPA Administrator may cancel these registrations by order and without a hearing; orders to cancel these registrations have been issued.

FOR FURTHER INFORMATION CONTACT: Mick Yanchulis, Information Technology and Resources Management Division (7502P), Office of Pesticide Programs, Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460–0001; telephone number: (703) 347–0237; email address: *yanchulis.michael@epa.gov.*

Product-specific status inquiries may be made by calling toll-free, 1–800–444–7255.

SUPPLEMENTARY INFORMATION:

I. General Information

A. Does this action apply to me?

This action is directed to the public in general. Although this action may be of particular interest to persons who produce or use pesticides, the Agency has not attempted to describe all the specific entities that may be affected by this action.

B. How can I get copies of this document and other related information?

The docket for this action, identified by docket identification (ID) number EPA–HQ–OPP–2014–0673, is available at *http://www.regulations.gov* or at the Office of Pesticide Programs Regulatory Public Docket (OPP Docket) in the Environmental Protection Agency Docket Center (EPA/DC), West William Jefferson Clinton Bldg., Rm. 3334, 1301 Constitution Ave. NW., Washington, DC 20460–0001. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the OPP Docket is (703) 305–5805. Please review the visitor instructions and additional information about the docket available at *http://www.epa.gov/dockets.*

Complete lists of registrations canceled for non-payment of the maintenance fee are also available for reference in the OPP Docket.

II. Background

Section 4(i)(5) of FIFRA (7 U.S.C. 136a–1(i)(5)) requires that all pesticide registrants pay an annual registration maintenance fee, due by January 15 of each year, to keep their registrations in effect. This requirement applies to all registrations granted under FIFRA section 3 as well as those granted under FIFRA section 24(c) to meet special local needs. Registrations for which the fee is not paid are subject to cancellation by order and without a hearing.

Under FIFRA, the EPA Administrator may reduce or waive maintenance fees for minor agricultural use pesticides when it is determined that the fee would be likely to cause significant impact on the availability of the pesticide for the use.

In fiscal year 2014, maintenance fees were collected in one billing cycle. In late November of 2013, all holders of either FIFRA section 3 registrations or FIFRA section 24(c) registrations were sent lists of their active registrations, along with forms and instructions for responding. They were asked to identify which of their registrations they wished to maintain in effect, and to calculate and remit the appropriate maintenance fees. Most responses were received by the statutory deadline of January 15. A notice of intent to cancel was sent in April of 2014 to companies who did not respond and to companies who responded, but paid for less than all of their registrations. Since mailing the notices of intent to cancel, EPA has maintained a toll-free inquiry number through which the questions of affected registrants have been answered.

In fiscal year 2014, the Agency has waived the fee for 266 minor agricultural use registrations at the request of the registrants. Maintenance fees have been paid for about 15,999 FIFRA section 3 registrations, or about

Notice of Public Meeting for the Draft Environmental Impact Statement for the Disposal and Reuse of the Former Naval Weapons Station Seal Beach, Detachment Concord, Concord, California

AGENCY: Department of the Navy, DoD

ACTION: Notice

SUMMARY: Pursuant to the National Environmental Policy Act (NEPA) of 1969 (Pub. L. 91-190, 42 United States Code [U.S.C.] 4321-4347), as implemented by the Council on Environmental Quality Regulations implementing NEPA (40 Code of Federal Regulations [CFR] Parts 1500–1508), the Department of the Navy (DoN) has prepared and filed the Draft Environmental Impact Statement (EIS) to evaluate the potential environmental consequences associated with the disposal of the former Naval Weapons Station Seal Beach, Detachment Concord, Concord, California (NWS Concord), and its subsequent reuse by the local community. The DoN is initiating a 45-day public comment period to provide the community an opportunity to comment on the Draft EIS. Federal, state, and local elected officials and agencies and the public are encouraged to provide written comments. A public meeting will also be held to provide information and receive written comments on the Draft EIS.

DATES AND ADDRESSES: An open house public meeting will be held at the location listed below and will allow individuals to review and comment on the information presented in the Draft EIS. DoN representatives will be available during the open house to clarify information presented in the Draft EIS as necessary. There will not be a formal presentation.

Concord Senior Citizens Center (Wisteria Room)
2727 Parkside Circle
Concord, California 94519

Thursday, November 13, 2014 (4:00 p.m. to 8:00 p.m.)

FOR FURTHER INFORMATION, CONTACT:
Director, NAVFAC BRAC PMO West, Attn: Ms. Erica Spinelli, NEPA Project Manager, 1455 Frazee Road, Suite 900, San Diego, California, 92108-4310 , telephone: 619-532-0980, fax: 619-532-0995; e-mail: erica.spinelli@navy.mil

For more information on the NWS Concord EIS, visit the Navy BRAC PMO Website (http://www.bracpmo.navy.mil/).

SUPPLEMENTARY INFORMATION: The DoN has prepared the Draft EIS for the Disposal and Reuse of the Former NWS Concord in accordance with the requirements of NEPA (42 U.S.C. Sections 4321–4347) and its implementing regulations (40 CFR Parts 1500–1508). A Notice of Intent (NOI) to prepare this Draft EIS was published in the *Federal Register* on March 14, 2013 (*Federal Register*, Vol. 78, No. 50/Friday, March 14, 2013/Notices). The DoN is the lead agency for the proposed action, with the U.S. Army Corps of Engineers (USACE) serving as a cooperating agency for the preparation of this EIS.

The DoN closed the former NWS Concord on September 30, 2008, in accordance with Public Law (P. L.) 101-510, the Defense Base Closure and Realignment Act of 1990, as amended in 2005 (DBCRA). The DBCRA exempts the decision-making process of the Defense Base Closure and Realignment Commission from the requirements of NEPA. The DBCRA also relieves the DoN from the NEPA requirements to consider the need for closing, realigning, or transferring functions and from looking at alternative installations to close or realign. However, in accordance with NEPA, before disposing of any real property, the DoN must analyze the environmental effects of the disposal.

The purpose of the proposed action is to dispose of surplus property at the former NWS Concord for subsequent reuse in a manner consistent with the policies adopted by the City of Concord during reuse planning that took place between 2008 and 2012. The need for the proposed action is to provide the local community the opportunity for economic development and job creation.

The Draft EIS has considered two redevelopment alternatives for the disposal and reuse of NWS Concord. Both redevelopment alternatives would be generally consistent with the policies developed by the City of Concord during the reuse planning process that took place between 2008 and 2012. Both alternatives focus on the preservation of a significant amount of open space and conservation areas, and sustainable development characterized by walkable neighborhoods, transit-oriented development, and "complete streets" that balance multiple types of transportation. Under both alternatives, most installation facilities would be demolished, and the western side of the property would be developed as a series of mixed-use "development districts," with a higher concentration of development at the north end, near State Route 4 and the North Concord/Martinez Bay Area Rapid Transit (BART) Station. Redevelopment under either alternative would include parks and open spaces, best management practices for stormwater management, and green and sustainable design and planning principles. Full build-out under either alternative would be implemented over a 25-year period. A No Action alternative was also considered, as required by NEPA and to provide a point of comparison for assessing impacts of the redevelopment alternatives.

Alternative 1 includes the disposal of the former NWS Concord by the DoN and its reuse in a manner consistent with the adopted *Concord Reuse Project (CRP) Area Plan*. This alternative has been identified as the Preferred Alternative by the DoN. Under this alternative, redevelopment of approximately 2,500 acres of the former installation property would take place and would include a mix of land use types and densities. This alternative would also result in the preservation of a significant area of open space and conservation areas. The redevelopment would include approximately 6.1 million square feet of commercial floor space and up to 12,272 residential housing units.

Alternative 2 provides for the disposal of the former installation property by the DoN and its reuse in a manner similar to the Area Plan but with a higher density of residential development than under Alternative 1 and within a smaller footprint. Under this alternative, redevelopment of approximately 2,200 acres of the former installation property with a mix of land use types and densities would take place. This alternative would also include the preservation of a significant amount of open space and conservation areas. The alternative calls for approximately 6.1 million square feet of commercial building space and up to 15,872 residential housing units. Alternative 2 as presented in the Draft EIS is different from Alternative 2 as presented in the NOI circulated during the public scoping period in March and April 2013. Alternative 2 was revised by the DoN in response to comments received during the public scoping period to be more consistent with the land use planning policies adopted by the City of Concord as well as known and foreseeable market conditions. Comments on Alternative 2 received during the scoping period addressed the

smaller area designated for conservation and open space in this alternative, as well as concerns regarding higher levels of traffic, noise, and air impacts. Accordingly, the revised Alternative 2 is more similar to the adopted policies of the City of Concord as expressed in the CRP Area Plan, reflecting a similar but slightly smaller development footprint and representing a realistic reuse scenario.

The No Action Alternative is also analyzed in the Draft EIS, as required by NEPA. Under this alternative, NWS Concord would be retained by the U.S. government in caretaker status. No reuse or redevelopment would occur.

The Draft EIS addresses potential environmental impacts under each alternative associated with land use and zoning; socioeconomics and environmental justice; air quality and greenhouse gases (GHGs); biological resources; cultural resources; topography, geology, and soils; hazards and hazardous substances; noise; public services; transportation, traffic, and circulation; utilities and infrastructure; visual resources and aesthetics; and water resources. The analysis addresses direct and indirect impacts, and accounts for cumulative impacts from other foreseeable federal, state, or local activities at and around the former NWS Concord property. The DoN conducted a scoping process to identify community concerns and local issues that should be addressed in the EIS. The DoN considered the comments provided, which identified specific issues or topics of environmental concern, in determining the scope of the EIS. The Draft EIS identifies significant adverse impacts to air quality and traffic, and significant beneficial impacts to socioeconomics and public services. The Draft EIS has been distributed to various federal, state, and local agencies, as well as other interested individuals and organizations.

Federal, state, and local agencies, as well as interested members of the public, are invited and encouraged to review and comment on the Draft EIS. The Draft EIS is available for viewing at the following locations:

Concord Library, 2900 Salvio Street, Concord, CA 94519
Pittsburg Library, 80 Power Avenue, Pittsburg, CA 94565
Pleasant Hill Library, 1750 Oak Park Boulevard, Pleasant Hill, CA 94523

An electronic version of the Draft EIS can be viewed or downloaded at the following website: http://www.bracpmo.navy.mil. A limited number of hard copies are available by contacting the DoN's Base Realignment and Closure Program Management Office (BRAC PMO) at the address in this notice.

Comments can be made in the following ways: (1) written statements can be submitted to a DoN representative at the public meeting; (2) written comments can be mailed to Director, NAVFAC BRAC PMO West, Attn: Ms. Erica Spinelli, NEPA Project Manager, 1455 Frazee Road, Suite 900, San Diego, California, 92108-4310; (3) written comments can be e-mailed to erica.spinelli@navy.mil; or (4) comments can be faxed to 619-532-0995, Attn: Ms. Erica Spinelli. Comments may be submitted without attending the public meeting. All comments postmarked or e-mailed no later than midnight, November 25, 2014, will become part of the public record and will be responded to in the Final EIS.

Requests for special assistance, sign language interpretation for the hearing impaired, language interpreters, or other auxiliary aids for the scheduled public meeting must be sent by mail or e-mail to Ms. Jone Guerin, Ecology and Environment, Inc., 368 Pleasant View Drive, Lancaster, NY 14086, telephone: 716-684-8060, e-mail: jguerin@ene.com no later than October 30, 2014.

NOTICE OF AVAILABILITY AND ANNOUNCEMENT OF PUBLIC MEETING: DRAFT ENVIRONMENTAL IMPACT STATEMENT FOR THE DISPOSAL AND REUSE OF THE FORMER NAVAL WEAPONS STATION SEAL BEACH, DETACHMENT CONCORD (NWS CONCORD), CONCORD, CALIFORNIA

Pursuant to the National Environmental Policy Act (NEPA), the Department of the Navy (U.S. Navy) announces the availability of the Draft Environmental Impact Statement (DEIS) on the disposal of the former Naval Weapons Station Seal Beach, Detachment Concord, Concord, California (NWS Concord), and its subsequent reuse by the local community. The U.S. Navy will hold an open house public meeting in Concord, Contra Costa County, California, to receive comments on the DEIS. There will not be a formal presentation.

The open house public meeting is scheduled as follows:

Date: Thursday, November 13, 2014

Time: 4:00 – 8:00 p.m.

Location: Concord Senior Citizens Center
(Wisteria Room)
2727 Parkside Circle
Concord, CA 94519

You may submit written comments on the DEIS via mail, fax, and email. All comments must be postmarked or received by midnight November 25, 2014, and sent to:

Director, NAVFAC BRAC PMO West
Attn: Ms. Erica Spinelli
NEPA Project Manager
1455 Frazee Road, Suite 900

SUPPLEMENTARY INFORMATION: The DoN has prepared the Draft EIS for the Disposal and Reuse of the Former NWS Concord in accordance with the requirements of NEPA (42 U.S.C. Sections 4321–4347) and its implementing regulations (40 CFR Parts 1500–1508). A Notice of Intent (NOI) to prepare this Draft EIS was published in the Federal Register on March 14, 2013 (Federal Register, Vol. 78, No. 50/Friday, March 14, 2013/Notices). The DoN is the lead agency for the proposed action, with the U.S. Army Corps of Engineers (USACE) serving as a cooperating agency for the preparation of this EIS.

The DoN closed the former NWS Concord on September 30, 2008, in accordance with Public Law (P. L.) 101-510, the Defense Base Closure and Realignment Act of 1990, as amended in 2005 (DBCRA). The DBCRA exempts the decision-making process of the Defense Base Closure and Realignment Commission from the requirements of NEPA. The DBCRA also relieves the DoN from the NEPA requirements to consider the need for closing, realigning, or transferring functions and from looking at alternative installations to close or realign. However, in accordance with NEPA, before disposing of any real property, the DoN must analyze the environmental effects of the disposal.

The purpose of the proposed action is to dispose of surplus property at the former NWS Concord for subsequent reuse in a manner consistent with the policies adopted by the City of Concord during reuse planning that took place between 2008 and 2012. The need for the proposed action is to provide the local community the opportunity for economic development and job creation.

The Draft EIS has considered two redevelopment alternatives for the disposal and reuse of NWS Concord. Both redevelopment alternatives would be generally consistent with the policies developed by the City of Concord during the reuse planning process that took place between 2008 and 2012. Both alternatives focus on the preservation of a significant amount of open space and conservation areas, and sustainable development characterized by walkable neighborhoods, transit-oriented development, and “complete streets” that balance multiple types of transportation. Under both alternatives, most installation facilities would be demolished, and the western side of the property would be developed as a series of mixed-use “development districts,” with a higher concentration of development at the north end, near State Route 4 and the North Concord/Martinez Bay Area Rapid Transit (BART) Station. Redevelopment under either alternative would include parks and open spaces, best management practices for stormwater management, and green and sustainable design and planning principles. Full build-out under either alternative would be implemented over a 25-year period. A No Action alternative was also considered, as required by NEPA and to provide a point of comparison for assessing impacts of the redevelopment alternatives.

Alternative 1 includes the disposal of the former NWS Concord by the DoN and its reuse in a manner consistent with the adopted Concord Reuse Project (CRP) Area Plan. This alternative has

been identified as the Preferred Alternative by the DoN. Under this alternative, redevelopment of approximately 2,500 acres of the former installation property would take place and would include a mix of land use types and densities. This alternative would also result in the preservation of a significant area of open space and conservation areas. The redevelopment would include approximately 6.1 million square feet of commercial floor space and up to 12,272 residential housing units.

Alternative 2 provides for the disposal of the former installation property by the DoN and its reuse in a manner similar to the Area Plan but with a higher density of residential development than under Alternative 1 and within a smaller footprint. Under this alternative, redevelopment of approximately 2,200 acres of the former installation property with a mix of land use types and densities would take place. This alternative would also include the preservation of a significant amount of open space and conservation areas. The alternative calls for approximately 6.1 million square feet of commercial building space and up to 15,872 residential housing units. Alternative 2 as presented in the Draft EIS is different from Alternative 2 as presented in the NOI circulated during the public scoping period in March and April 2013. Alternative 2 was revised by the DoN in response to comments received during the public scoping period to be more consistent with the land use planning policies adopted by the City of Concord as well as known and foreseeable market conditions. Comments on Alternative 2 received during the scoping period addressed the smaller area designated for conservation and open space in this alternative, as well as concerns regarding higher levels of traffic, noise, and air impacts. Accordingly, the revised Alternative 2 is more similar to the adopted policies of the City of Concord as expressed in the CRP Area Plan, reflecting a similar but slightly smaller development footprint and representing a realistic reuse scenario.

The No Action Alternative is also analyzed in the Draft EIS, as required by NEPA. Under this alternative, NWS Concord would be retained by the U.S. government in caretaker status. No reuse or redevelopment would occur.

The Draft EIS addresses potential environmental impacts under each alternative associated with land use and zoning; socioeconomics and environmental justice; air quality and greenhouse gases (GHGs); biological resources; cultural resources; topography, geology, and soils; hazards and hazardous substances; noise; public services; transportation, traffic, and circulation; utilities and infrastructure; visual resources and aesthetics; and water resources. The analysis addresses direct and indirect impacts, and accounts for cumulative impacts from other foreseeable federal, state, or local activities at and around the former NWS Concord property. The DoN conducted a scoping process to identify community concerns and local issues that should be addressed in the EIS. The DoN considered the comments provided, which identified specific issues or topics of environmental concern, in determining the scope of the EIS. The Draft EIS identifies significant adverse impacts to air quality and traffic, and significant beneficial impacts to socioeconomics and public services. The Draft EIS has been distributed to various federal, state, and local agencies, as well as other interested individuals and organizations.

Federal, state, and local agencies, as well as interested members of the public, are invited and encouraged to review and comment on the Draft EIS. The Draft EIS is available for viewing at the following locations:
